
Bitcoinlib Documentation

Release 0.3

Lennart Jongeneel (mccwdev)

Oct 30, 2018

1	Wallet	3
2	Segregated Witness Wallet	5
3	Wallet from passphrase with accounts and multiple currencies	7
4	Multi Signature Wallets	9
5	Command Line Tool	11
6	Service providers	13
7	More examples	15
8	Disclaimer	75
9	Schematic overview	77
10	Indices and tables	79
	Python Module Index	81

Bitcoin and other Cryptocurrencies Library for Python. Includes a fully functional wallet, Mnemonic key generation and management and connection with various service providers to receive and send blockchain and transaction information.

CHAPTER 1

Wallet

The bitcoinlibrary contains a wallet implementation using sqlalchemy and sqlite3 to import, create and manage keys in a Hierarchical Deterministic Way.

Example: Create wallet and generate new key to receive bitcoins

```
>>> from bitcoinlib.wallets import HDWallet
>>> w = HDWallet.create('Wallet1')
>>> w
<HDWallet (id=1, name=Wallet1, network=bitcoin)>
>>> key1 = w.new_key()
>>> key1
<HDWalletKey (name=Key 0, wif=xprvA4B..etc..6HZKGW7Kozc, path=m/44'/0'/0'/0/0)>
>>> key1.address
'1Fo7STj6LdRhUuD1AiEsHpH65pXzraGJ9j'
```

When your wallet received a payment and has unspent transaction outputs, you can send bitcoins easily. If succesfull a transaction ID is returned

```
>>> w.send_to('12ooWd8Xag7hsgP9PBPnmyGe36VeUrpMSH', 100000)
'b7feea5e7c79d4f6f343b5ca28fa2a1fcacfe9a2b7f44f3d2fd8d6c2d82c4078'
```

Segregated Witness Wallet

Easily create and manage segwit wallets. Both native segwit with base32/bech32 addresses and P2SH nested segwit wallets with traditional addresses are available.

Create a native single key P2WPKH wallet:

```
>>> from bitcoinlib.wallets import HDWallet
>>> w = HDWallet.create('segwit_p2wpkh', witness_type='segwit')
>>> w.get_key().address
bc1q84y2quplejutvu0h4gw9hy59fppu3thg0u2xz3
```

Or create a P2SH nested single key P2SH_P2WPKH wallet:

```
>>> from bitcoinlib.wallets import HDWallet
>>> w = HDWallet.create('segwit_p2sh_p2wpkh', witness_type='p2sh-segwit')
>>> w.get_key().address
36ESSWgR4WxXJSc4ysDSJvecyY6FJkhUbp
```

Wallet from passphrase with accounts and multiple currencies

The following code creates a wallet with two bitcoin and one litecoin account from a Mnemonic passphrase. The complete wallet can be recovered from the passphrase which is the masterkey.

```
from bitcoinlib.wallets import HDWallet, wallet_delete
from bitcoinlib.mnemonic import Mnemonic

passphrase = Mnemonic().generate()
print(passphrase)
w = HDWallet.create("Wallet2", key=passphrase, network='bitcoin')
account_btc2 = w.new_account('Account BTC 2')
account_ltc1 = w.new_account('Account LTC', network='litecoin')
w.get_key()
w.get_key(account_btc2.account_id)
w.get_key(account_ltc1.account_id)
w.info()
```

Multi Signature Wallets

Create a Multisig wallet with 2 cosigner which both need to sign a transaction.

```

from bitcoinlib.wallets import HDWallet
from bitcoinlib.keys import HDKey

NETWORK = 'testnet'
pk1 = HDKey(
    ↳ 'tprv8ZgxMBicQKsPd1Q44tfDiZC98iYouKRC2CzjT3HGt1yYw2zuX2awTotzGAZQEAU9bi2M5MCj8iedP9MREpUgpdEBwBgG
    ↳ '
        '5zNYeiX8', network=NETWORK)
pk2 = HDKey(
    ↳ 'tprv8ZgxMBicQKsPeUbMS6kswJc11zgVEXUnUZuGo3bF6bBrAglieFfUdPc9UHqbD5HcXizThrcKike1c4z6xHrz6MWGwy8L6
    ↳ '
        'MeQHdWDp', network=NETWORK)
w1 = HDWallet.create_multisig('multisig_2of2_cosigner1', sigs_required=2,
    key_list=[pk1, pk2.account_multisig_key().wif_
    ↳ public()], network=NETWORK)
w2 = HDWallet.create_multisig('multisig_2of2_cosigner2', sigs_required=2,
    key_list=[pk1.account_multisig_key().wif_public(),
    ↳ pk2], network=NETWORK)
print("Deposit testnet bitcoin to this address to create transaction: ", w1.get_key().
    ↳ address)

```

Create a transaction in the first wallet

```

w1.utxos_update()
t = w1.sweep('mwCwTceJvYV27KXBc3NJZys6CjsgsoeHmf', min_confirms=0)
t.info()

```

And then import the transaction in the second wallet, sign it and push it to the network

```

w2.get_key()
t2 = w2.transaction_import(t)
t2.sign()

```

(continues on next page)

(continued from previous page)

```
t2.send()  
t2.info()
```

Command Line Tool

With the command line tool you can create and manage wallet without any Python programming.

To create a new Bitcoin wallet

```
$ cli-wallet NewWallet
Command Line Wallet for BitcoinLib

Wallet newwallet does not exist, create new wallet [yN]? y

CREATE wallet 'newwallet' (bitcoin network)

Your mnemonic private key sentence is: force humble chair kiss season ready elbow_
↳cool awake divorce famous tunnel

Please write down on paper and backup. With this key you can restore your wallet and_
↳all keys
```

You can use 'cli-wallet' to create simple or multisig wallets for various networks, manage public and private keys and managing transactions.

For the full command line wallet documentation please read

http://bitcoinlib.readthedocs.io/en/latest/_static/manuals.command-line-wallet.html

CHAPTER 6

Service providers

Communicates with pools of bitcoin service providers to retrieve transaction, address, blockchain information. To push a transaction to the network. To determine optimal service fee for a transaction. Or to update your wallet's balance.

Example: Get estimated transactionfee in sathosis per Kb for confirmation within 5 blocks

```
>>> from bitcoinlib.services.services import Service
>>> Service().estimatefee(5)
138964
```

For more examples see <https://github.com/1200wd/bitcoinlib/tree/master/examples>

7.1 Install, Update and Tweak BitcoinLib

7.1.1 Installation

Install with pip

```
$ pip install bitcoinlib
```

Package can be found at <https://pypi.python.org/pypi/bitcoinlib/>

Install from source

```
$ git clone https://github.com/1200wd/bitcoinlib
$ cd bitcoinlib
$ python setup.py install
```

Package dependencies

Required Python Packages, are automatically installed upon installing bitcoinlib:

- ecdsa
- pyaes
- scrypt
- sqlalchemy

- requests
- enum34 (for older python installations)

Other requirements Linux

```
sudo apt install python-dev python3-dev
```

To install OpenSSL development package on Debian, Ubuntu or their derivatives

```
sudo apt install libssl-dev
```

To install OpenSSL development package on Fedora, CentOS or RHEL

```
sudo yum install openssl-devel
```

Other requirements Windows

Tested on Windows 10 with Python 3.6 and pip installed. No special requirements needed.

7.1.2 Update Bitcoinlib

Before you update make sure to backup your database! Also backup your settings files in `./bitcoinlib/config` if you have made any changes.

If you installed the library with pip upgrade with

```
$ pip install bitcoinlib --upgrade
```

Otherwise pull the git repository.

After an update it might be necessary to update the config files. The config files will be overwritten with new versions if you delete the `./bitcoinlib/logs/install.log` file.

```
$ rm ./bitcoinlib/logs/install.log
```

If the new release contains database updates you have to migrate the database with the `updatedb.py` command. This program extracts keys and some wallet information from the old database and then creates a new database. The `updatedb.py` command is just a helper tool and not guaranteed to work, it might fail if there are a lot of database changes. So backup database / private keys first and use at your own risk!

```
$ python updatedb.py
Wallet and Key data will be copied to new database. Transaction data will NOT be
↳copied
Updating database file: /home/guest/.bitcoinlib/database/bitcoinlib.sqlite
Old database will be backed up to /home/guest/.bitcoinlib/database/bitcoinlib.sqlite.
↳backup-20180711-01:46
Type 'y' or 'Y' to continue or any other key to cancel: y
```

7.1.3 Tweak BitcoinLib

You can [Add another service Provider](#) to this library by updating settings and write a new service provider class.

If you use this library in a production environment it is advised to run your own Bitcoin, Litecoin or Dash node, both for privacy and reliability reasons. More setup information: [Setup connection to bitcoin node](#)

Some service providers require an API key to function or allow additional requests. You can add this key to the provider settings file in `.bitcoinlib/config/providers.json`

7.2 Command Line Wallet

Manage wallets from commandline. Allows you to

- Show wallets and wallet info
- Create single and multi signature wallets
- Delete wallets
- Generate receive addresses
- Create transactions
- Import and export transactions
- Sign transactions with available private keys
- Broadcast transaction to the network

The Command Line wallet Script can be found in the tools directory. If you call the script without arguments it will show all available wallets.

Specify a wallet name or wallet ID to show more information about a wallet. If you specify a wallet which doesn't exist the script will ask you if you want to create a new wallet.

7.2.1 Create wallet

To create a wallet just specify an unused wallet name:

```
$ cli-wallet mywallet
Command Line Wallet for BitcoinLib

Wallet mywallet does not exist, create new wallet [yN]? y

CREATE wallet 'mywallet' (bitcoin network)

Your mnemonic private key sentence is: mutual run dynamic armed brown meadow height_
↳elbow citizen put industry work

Please write down on paper and backup. With this key you can restore your wallet and_
↳all keys

Type 'yes' if you understood and wrote down your key: yes
Updating wallet
```

7.2.2 Generate / show receive addresses

To show an unused address to receive funds use the `-r` or `--receive` option. If you want to show QR codes on the commandline install the `pyqrcode` module.

```
$ cli-wallet mywallet -r
Command Line Wallet for BitcoinLib

Receive address is 1JMKBiiDMdjTx6rfqGumALvcRMX6DQNeG1
```

7.2.3 Send funds / create transaction

To send funds use the `-t` option followed by the address and amount. You can also repeat this to send to multiple addresses.

A manual fee can be entered with the `-f` / `--fee` option.

The default behavior is to just show the transaction info and raw transaction. You can push this to the network with a 3rd party. Use the `-p` / `--push` option to push the transaction to the network.

```
$ cli-wallet -d dbtest mywallet -t 1FpBBJ2E9w9nqxHUAtQME8X4wGeAKBsKwZ 10000
```

7.2.4 Restore wallet with passphrase

To restore or create a wallet with a passphrase use new wallet name and the `--passphrase` option. If it's an old wallet you can recreate and scan it with the `-s` option. This will create new addresses and update unspent outputs.

```
$ cli-wallet mywallet --passphrase "mutual run dynamic armed brown meadow height_
↪elbow citizen put industry work"
$ cli-wallet mywallet -s
```

7.2.5 Options Overview

Command Line Wallet for BitcoinLib

```
usage: cli_wallet.py [-h] [--wallet-remove] [--list-wallets] [--wallet-info]
                    [--update-utxos] [--update-transactions]
                    [--wallet-recreate] [--receive [NUMBER_OF_ADDRESSES]]
                    [--generate-key] [--export-private]
                    [--passphrase [PASSPHRASE [PASSPHRASE ...]]]
                    [--passphrase-strength PASSPHRASE_STRENGTH]
                    [--network NETWORK] [--database DATABASE]
                    [--create-from-key KEY]
                    [--create-multisig [NUMBER_OF_SIGNATURES_REQUIRED [KEYS ...]]]
                    [--create-transaction [ADDRESS_1 [AMOUNT_1 ...]]]
                    [--sweep ADDRESS] [--fee FEE] [--fee-per-kb FEE_PER_KB]
                    [--push] [--import-tx TRANSACTION]
                    [--import-tx-file FILENAME_TRANSACTION]
                    [wallet_name]
```

BitcoinLib CLI

positional arguments:

wallet_name	Name of wallet to create or open. Used to store your all your wallet keys and will be printed on each paper wallet
-------------	--

optional arguments:

(continues on next page)

(continued from previous page)

```

-h, --help                show this help message and exit

Wallet Actions:
--wallet-remove           Name or ID of wallet to remove, all keys and
                           transactions will be deleted
--list-wallets, -l       List all known wallets in BitcoinLib database
--wallet-info, -w        Show wallet information
--update-utxos, -x       Update unspent transaction outputs (UTXO's) for this
                           wallet
--update-transactions, -u Update all transactions and UTXO's for this wallet
--wallet-recreate, -z    Delete all keys and transactions and recreate wallet,
                           except for the masterkey(s). Use when updating fails
                           or other errors occur. Please backup your database and
                           masterkeys first.
--receive [NUMBER_OF_ADDRESSES], -r [NUMBER_OF_ADDRESSES]
                           Show unused address to receive funds. Generate new
                           payment andchange addresses if no unused addresses are
                           available.
--generate-key, -k       Generate a new masterkey, and show passphrase, WIF and
                           public account key. Use to createmultisig wallet
--export-private, -e     Export private key for this wallet and exit

Wallet Setup:
--passphrase [PASSPHRASE [PASSPHRASE ...]]
                           Passphrase to recover or create a wallet. Usually 12
                           or 24 words
--passphrase-strength PASSPHRASE_STRENGTH
                           Number of bits for passphrase key. Default is 128,
                           lower is not adviced but can be used for testing. Set
                           to 256 bits for more future proof passphrases
--network NETWORK, -n NETWORK
                           Specify 'bitcoin', 'litecoin', 'testnet' or other
                           supported network
--database DATABASE, -d DATABASE
                           Name of specific database file to use
--create-from-key KEY, -c KEY
                           Create a new wallet from specified key
--create-multisig [NUMBER_OF_SIGNATURES_REQUIRED [KEYS ...]], -m [NUMBER_OF_
↪SIGNATURES_REQUIRED [KEYS ...]]
                           Specificy number of signatures required followed by a
                           list of signatures. Example: -m 2 tprv8ZgxMBicQKsPd1Q4
                           4tfDiZC98iYouKRC2CzjT3HGtlyYw2zuX2awTotzGAZQEAU9bi2M5M
                           Cj8iedP9MREPjUgpDEBwBgGi2C8eK5zNYeiX8 tprv8ZgxMBicQKsP
                           eUbMS6kswJc11zgVEXUnUZuGo3bF6bBrAglieFfUdPc9UHqbD5HcXi
                           zThrcKikelc4z6xHrz6MWGwy8L6YKVbgJMeQHdWDp

Transactions:
--create-transaction [ADDRESS_1 [AMOUNT_1 ...]], -t [ADDRESS_1 [AMOUNT_1 ...]]
                           Create transaction. Specify address followed by
                           amount. Repeat for multiple outputs
--sweep ADDRESS          Sweep wallet, transfer all funds to specified address
--fee FEE, -f FEE       Transaction fee
--fee-per-kb FEE_PER_KB
                           Transaction fee in sathosis (or smallest denominator)
                           per kilobyte

```

(continues on next page)

(continued from previous page)

```

--push, -p          Push created transaction to the network
--import-tx TRANSACTION, -i TRANSACTION
                    Import raw transaction hash or transaction dictionary
                    in wallet and sign it with available key(s)
--import-tx-file FILENAME_TRANSACTION, -a FILENAME_TRANSACTION
                    Import transaction dictionary or raw transaction
                    string from specified filename and sign it with
                    available key(s)

```

7.3 Add a new Service Provider

The Service class connects to providers such as Blockchain.info or Blockexplorer.com to retrieve transaction, network, block, address information, etc

The Service class automatically selects a provider which has requested method available and selects another provider if method fails.

7.3.1 Steps to add a new provider

- The preferred way is to create a github clone and update code there (and do a pull request...)
- Add the provider settings in the providers.json file in the configuration directory.

Example:

```

{
  "bitgo": {
    "provider": "bitgo",
    "network": "bitcoin",
    "client_class": "BitGo",
    "provider_coin_id": "",
    "url": "https://www.bitgo.com/api/v1/",
    "api_key": "",
    "priority": 10,
    "denominator": 1,
    "network_overrides": null
  }
}

```

- Create a new Service class in bitcoinlib.services. Create a method for available API calls and rewrite output if needed.

Example:

```

from bitcoinlib.services.baseclient import BaseClient

PROVIDERNAME = 'bitgo'

class BitGoClient(BaseClient):

    def __init__(self, network, base_url, denominator, api_key=''):
        super(self.__class__, self).\
            __init__(network, PROVIDERNAME, base_url, denominator, api_key)

```

(continues on next page)

(continued from previous page)

```

def compose_request(self, category, data, cmd='', variables=None, method='get'):
    if data:
        data = '/' + data
    url_path = category + data
    if cmd:
        url_path += '/' + cmd
    return self.request(url_path, variables, method=method)

def estimatefee(self, blocks):
    res = self.compose_request('tx', 'fee', variables={'numBlocks': blocks})
    return res['feePerKb']

```

- Add this service class to `__init__.py`

```
import bitcoinlib.services.bitgo
```

- Remove `install.log` file in `bitcoinlib`'s log directory, this will copy all provider settings next time you run the bitcoin library. See `'initialize_lib'` method in `main.py`
- Specify new provider and create service class object to test your new class and it's method

```

from bitcoinlib import services

srv = Service(providers=['blockexplorer'])
print(srv.estimatefee(5))

```

7.4 How to connect bitcoinlib to a bitcoin node

This manual explains how to connect to a bitcoind server on your localhost or an a remote server.

Running your own bitcoin node allows you to create a large number of requests, faster response times, and more control, privacy and independence. However you need to install and maintain it and it used a lot of resources.

7.4.1 Bitcoin node settings

This manual assumes you have a full bitcoin node up and running. For more information on how to install a full node read <https://bitcoin.org/en/full-node>

Please make sure you have `server` and `txindex` option set to 1.

So your `bitcoin.conf` file for testnet should look something like this. For mainnet use port 8332, and remove the `'testnet=1'` line.

```

[rpc]
rpcuser=bitcoinrpc
rpcpassword=some_long_secure_password
server=1
port=18332
txindex=1
testnet=1

```

7.4.2 Connect using config files

Bitcoinlib looks for bitcoind config files on localhost. So if you running a full bitcoin node from your local PC as the same user everything should work out of the box.

Config files are read from the following files in this order: * [USER_HOME_DIR]/.bitcoinlib/config/bitcoin.conf * [USER_HOME_DIR]/.bitcoin/bitcoin.conf

If your config files are at another location, you can specify this when you create a BitcoinClient instance.

```
from bitcoinlib.services.bitcoind import BitcoinClient

bdc = BitcoinClient.from_config('/usr/local/src/.bitcoinlib/config/bitcoin.conf')
txid = 'e0cee8955f516d5ed333d081a4e2f55b999debfff91a49e8123d20f7ed647ac5'
rt = bdc.getrawtransaction(txid)
print("Raw: %s" % rt)
```

7.4.3 Connect using provider settings

Connection settings can also be added to the service provider settings file in .bitcoinlib/config/providers.json

Example:

```
"bitcoind.testnet": {
  "provider": "bitcoind",
  "network": "testnet",
  "client_class": "BitcoinClient",
  "url": "http://user:password@server_url:18332",
  "api_key": "",
  "priority": 11,
  "denominator": 100000000
}
```

7.4.4 Connect using base_url argument

Another options is to pass the 'base_url' argument to the BitcoinClient object directly.

This provides more flexibility but also responsibility to store user and password information secure.

```
from bitcoinlib.services.bitcoind import BitcoinClient

base_url = 'http://user:password@server_url:18332'
bdc = BitcoinClient(base_url=base_url)
txid = 'e0cee8955f516d5ed333d081a4e2f55b999debfff91a49e8123d20f7ed647ac5'
rt = bdc.getrawtransaction(txid)
print("Raw: %s" % rt)
```

7.5 bitcoinlib

7.5.1 bitcoinlib package

Subpackages

bitcoinlib.config package

Submodules

bitcoinlib.config.opcodes module

`bitcoinlib.config.opcodes.opcode` (*name*, *as_bytes=True*)
Get integer or byte character value of OP code by name.

Parameters

- **name** (*str*) – Name of OP code as defined in opcodenames
- **as_bytes** (*bool*) – Return as byte or int? Default is bytes

Return int, bytes

bitcoinlib.config.secp256k1 module

Module contents

bitcoinlib.services package

Submodules

bitcoinlib.services.authproxy module

Copyright 2011 Jeff Garzik

AuthServiceProxy has the following improvements over python-jsonrpc's ServiceProxy class:

- HTTP connections persist for the life of the AuthServiceProxy object (if server supports HTTP/1.1)
- sends protocol 'version', per JSON-RPC 1.1
- sends proper, incrementing 'id'
- sends Basic HTTP authentication headers
- parses all JSON numbers that look like floats as Decimal
- uses standard Python json lib

Previous copyright, from python-jsonrpc/jsonrpc/proxy.py:

```
class bitcoinlib.services.authproxy.AuthServiceProxy (service_url, service_name=None, timeout=30, connection=None)
```

Bases: object

```
batch_ (rpc_calls)
```

Batch RPC call. Pass array of arrays: [["method", params...], ...] Returns array of results.

```
bitcoinlib.services.authproxy.EncodeDecimal (o)
```

```
exception bitcoinlib.services.authproxy.JSONRPCException (rpc_error)
```

Bases: Exception

bitcoinlib.services.baseclient module

```
class bitcoinlib.services.baseclient.BaseClient (network, provider, base_url, denominator, api_key="", provider_coin_id="", net_work_overrides=None)
```

Bases: object

```
request (url_path, variables=None, method='get')
```

```
exception bitcoinlib.services.baseclient.ClientError (msg="")
```

Bases: Exception

bitcoinlib.services.bitcoind module

```
class bitcoinlib.services.bitcoind.BitcoindClient (network='bitcoin', base_url="", denominator=100000000, *args)
```

Bases: *bitcoinlib.services.baseclient.BaseClient*

Class to interact with bitcoind, the Bitcoin daemon

Open connection to bitcoin node

Parameters

- **network** – Bitcoin mainnet or testnet. Default is bitcoin mainnet
- **base_url** – Connection URL in format http(s)://user:password@host:port.
- **denominator** – Denominator for this currency. Should be always 100000000 (satoshis) for bitcoin

Type str

Type str

Type str

block_count ()

estimatefee (*blocks*)

static from_config (*network='bitcoin'*)

Read settings from bitcoind config file

Parameters

- **configfile** – Path to config file. Leave empty to look in default places
- **network** – Bitcoin mainnet or testnet. Default is bitcoin mainnet

Type str

Type str

Return BitcoinClient

getrawtransaction (*txid*)

gettransaction (*txid*)

getutxos (*addresslist*)

sendrawtransaction (*rawtx*)

exception bitcoinlib.services.bitcoind.**ConfigError** (*msg=""*)

Bases: Exception

bitcoinlib.services.bitcoinlibtest module

class bitcoinlib.services.bitcoinlibtest.**BitcoinLibTestClient** (*network,*
base_url, *de-*
nominator,
**args*)

Bases: *bitcoinlib.services.baseclient.BaseClient*

Dummy service client for bitcoinlib test network. Only used for testing.

Does not make any connection to a service provider, so can be used offline.

block_count ()

estimatefee (*blocks*)

Dummy estimate fee method for the bitcoinlib testnet.

Parameters **blocks** (*int*) – Number of blocks

Return int Fee as 100000 // number of blocks

getbalance (*addresslist*)

Dummy getbalance method for bitcoinlib testnet

Parameters **addresslist** (*list*) – List of addresses

Return int

getutxos (*addresslist, utxos_per_address=2*)

Dummy method to retrieve UTXO's. This method creates a new UTXO for each address provided out of the testnet void, which can be used to create test transactions for the bitcoinlib testnet.

Parameters

- **addresslist** (*list*) – List of addresses

- **utxos_per_address** (*int*) – Number of UTXO's to be created per address

Return list The created UTXO set

sendrawtransaction (*rawtx*)

Dummy method to send transactions on the bitcoinlib testnet. The bitcoinlib testnet does not exist, so it just returns the transaction hash.

Parameters **rawtx** (*bytes*, *str*) – A raw transaction hash

Return str Transaction hash

bitcoinlib.services.bitgo module

class `bitcoinlib.services.bitgo.BitGoClient` (*network*, *base_url*, *denominator*, **args*)

Bases: `bitcoinlib.services.baseclient.BaseClient`

compose_request (*category*, *data*, *cmd=""*, *variables=None*, *method='get'*)

estimatefee (*blocks*)

getbalance (*addresslist*)

getrawtransaction (*txid*)

gettransaction (*tx_id*)

gettransactions (*addresslist*)

getutxos (*addresslist*)

bitcoinlib.services.blockchaininfo module

class `bitcoinlib.services.blockchaininfo.BlockchainInfoClient` (*network*, *base_url*, *denominator*, **args*)

Bases: `bitcoinlib.services.baseclient.BaseClient`

block_count ()

compose_request (*cmd*, *parameter=""*, *variables=None*, *method='get'*)

getbalance (*addresslist*)

getrawtransaction (*tx_id*)

gettransaction (*tx_id*)

gettransactions (*addresslist*)

getutxos (*addresslist*)

bitcoinlib.services.blockchair module

class `bitcoinlib.services.blockchair.BlockChairClient` (*network*, *base_url*, *denominator*, **args*)

Bases: `bitcoinlib.services.baseclient.BaseClient`

block_count ()

Get latest block number: The block number of last block in longest chain on the blockchain

Return int

compose_request (*command, query_vars=None, data=None, offset=0*)
estimatefee (*blocks*)
getbalance (*addresslist*)
gettransaction (*tx_id*)
gettransactions (*addresslist*)
getutxos (*addresslist*)

bitcoinlib.services.blockcypher module

class bitcoinlib.services.blockcypher.**BlockCypher** (*network, base_url, denominator, *args*)
 Bases: *bitcoinlib.services.baseclient.BaseClient*
block_count ()
compose_request (*function, data, parameter="", variables=None, method='get'*)
estimatefee (*blocks*)
getbalance (*addresslist*)
getrawtransaction (*tx_id*)
gettransaction (*tx_id*)
gettransactions (*addresslist, unspent_only=False*)
getutxos (*addresslist*)
sendrawtransaction (*rawtx*)

bitcoinlib.services.blockexplorer module

class bitcoinlib.services.blockexplorer.**BlockExplorerClient** (*network, base_url, denominator, *args*)
 Bases: *bitcoinlib.services.baseclient.BaseClient*
block_count ()
compose_request (*category, data, cmd="", variables=None, method='get'*)
getbalance (*addresslist*)
getrawtransaction (*tx_id*)
gettransaction (*tx_id*)
gettransactions (*addresslist*)
getutxos (*addresslist*)
sendrawtransaction (*rawtx*)

bitcoinlib.services.blocktrail module

```
class bitcoinlib.services.blocktrail.BlockTrail (network, base_url, denominator,  
                                              api_key, *args)  
    Bases: bitcoinlib.services.baseclient.BaseClient  
  
    compose_request (function, data, parameter="", variables=None, method='get', page=1)  
  
    estimatefee (blocks)  
  
    getbalance (addresslist)  
  
    gettransaction (tx_id)  
  
    gettransactions (addresslist)  
  
    getutxos (addresslist)
```

bitcoinlib.services.chainso module

```
class bitcoinlib.services.chainso.ChainSo (network, base_url, denominator, *args)  
    Bases: bitcoinlib.services.baseclient.BaseClient  
  
    block_count ()  
  
    compose_request (function, data="", parameter="", variables=None, method='get')  
  
    getbalance (addresslist)  
  
    getrawtransaction (txid)  
  
    gettransaction (tx_id)  
  
    gettransactions (address_list)  
  
    getutxos (addresslist)  
  
    sendrawtransaction (rawtx)
```

bitcoinlib.services.coinfees module

```
class bitcoinlib.services.coinfees.CoinfeesClient (network, base_url, denominator,  
                                                  *args)  
    Bases: bitcoinlib.services.baseclient.BaseClient  
  
    compose_request (category, cmd, method='get')  
  
    estimatefee (blocks)
```

bitcoinlib.services.cryptoid module

```
class bitcoinlib.services.cryptoid.CryptoID (network, base_url, denominator, *args)  
    Bases: bitcoinlib.services.baseclient.BaseClient  
  
    block_count ()  
  
    compose_request (func=None, path_type='api', variables=None, method='get')  
  
    getbalance (addresslist)  
  
    getrawtransaction (tx_id)
```

`gettransaction (tx_id)`

`gettransactions (addresslist)`

`getutxos (addresslist)`

bitcoinlib.services.dashd module

exception `bitcoinlib.services.dashd.ConfigError (msg=)`

Bases: `Exception`

class `bitcoinlib.services.dashd.DashdClient (network='dash', base_url='', denominator=100000000, *args)`

Bases: `bitcoinlib.services.baseclient.BaseClient`

Class to interact with dashd, the Dash daemon

Open connection to dashcore node

Parameters

- **network** – Dash mainnet or testnet. Default is dash mainnet
- **base_url** – Connection URL in format `http(s)://user:password@host:port`.
- **denominator** – Denominator for this currency. Should be always 100000000 (satoshis) for Dash

Type `str`

Type `str`

Type `str`

`block_count ()`

`estimatefee (blocks)`

static from_config (network='dash')

Read settings from dashd config file

Parameters

- **configfile** – Path to config file. Leave empty to look in default places
- **network** – Dash mainnet or testnet. Default is dash mainnet

Type `str`

Type `str`

Return DashdClient

`getrawtransaction (txid)`

`gettransaction (txid)`

`sendrawtransaction (rawtx)`

bitcoinlib.services.estimatefee module

class `bitcoinlib.services.estimatefee.EstimateFeeClient (network, base_url, denominator, *args)`

Bases: `bitcoinlib.services.baseclient.BaseClient`

`compose_request` (*cmd, parameter, method='get'*)

`estimatefee` (*blocks*)

bitcoinlib.services.litecoind module

exception `bitcoinlib.services.litecoind.ConfigError` (*msg=""*)

Bases: `Exception`

class `bitcoinlib.services.litecoind.LitecoindClient` (*network='litecoin', base_url="", denominator=100000000, *args*)

Bases: `bitcoinlib.services.baseclient.BaseClient`

Class to interact with litecoind, the Litecoin daemon

Open connection to litecoin node

Parameters

- **network** – Litecoin mainnet or testnet. Default is litecoin mainnet
- **base_url** – Connection URL in format `http(s)://user:password@host:port`.
- **denominator** – Denominator for this currency. Should be always 100000000 (satoshis) for litecoin

Type `str`

Type `str`

Type `str`

`block_count` ()

`estimatefee` (*blocks*)

static `from_config` (*network='litecoin'*)

Read settings from litecoind config file

Parameters

- **configfile** – Path to config file. Leave empty to look in default places
- **network** – Litecoin mainnet or testnet. Default is litecoin mainnet

Type `str`

Type `str`

Return `LitecoindClient`

`getrawtransaction` (*txid*)

`gettransaction` (*txid*)

`getutxos` (*addresslist*)

`sendrawtransaction` (*rawtx*)

bitcoinlib.services.litecoreio module

class bitcoinlib.services.litecoreio.**LitecoreIOClient** (*network, base_url, denominator, *args*)

Bases: *bitcoinlib.services.baseclient.BaseClient*

block_count ()

compose_request (*category, data, cmd="", variables=None, method='get'*)

getbalance (*addresslist*)

getrawtransaction (*tx_id*)

gettransaction (*tx_id*)

gettransactions (*addresslist*)

getutxos (*addresslist*)

sendrawtransaction (*rawtx*)

bitcoinlib.services.multiexplorer module

class bitcoinlib.services.multiexplorer.**MultiexplorerClient** (*network, base_url, denominator, *args*)

Bases: *bitcoinlib.services.baseclient.BaseClient*

compose_request (*func, variables, service_id='fallback', include_raw=False, method='get'*)

bitcoinlib.services.services module

class bitcoinlib.services.services.**Service** (*network='bitcoin', min_providers=1, max_providers=1, providers=None*)

Bases: *object*

Class to connect to various cryptocurrency service providers. Use to receive network and blockchain information, get specific transaction information, current network fees or push a raw transaction.

The Service class connects to 1 or more service providers at random to retrieve or send information. When a certain service provider fail it automatically tries another one.

Open a service object for the specified network. By default the object connect to 1 service provider, but you can specify a list of providers or a minimum or maximum number of providers.

Parameters

- **network** (*str, Network*) – Specify network used
- **min_providers** – Minimum number of providers to connect to. Default is 1. Use for instance to receive

fee information from a number of providers and calculate the average fee. :type min_providers: int :param max_providers: Maximum number of providers to connect to. Default is 1. :type max_providers: int :param providers: List of providers to connect to. Default is all providers and select a provider at random. :type providers: list, str

block_count ()

Get latest block number: The block number of last block in longest chain on the blockchain

Return int

estimatefee (*blocks=3*)

Estimate fee per kilobyte for a transaction for this network with expected confirmation within a certain amount of blocks

Parameters **blocks** (*int*) – Expectation confirmation time in blocks. Default is 3.

Return int Fee in smallest network denominator (satoshi)

getbalance (*addresslist, addresses_per_request=5*)

Get balance for each address in addresslist provided

Parameters

- **addresslist** (*list, str*) – Address or list of addresses
- **addresses_per_request** (*int*) – Maximum number of addresses per request. Default is 5. Use lower setting when you experience timeouts or service request errors, or higher when possible.

Return dict Balance per address

getrawtransaction (*txid*)

Get a raw transaction by its transaction hash

Parameters **txid** (*str*) – Transaction identification hash

Return str Raw transaction as hexstring

gettransaction (*txid*)

Get a transaction by its transaction hash

Parameters **txid** (*str*) – Transaction identification hash

Return Transaction A single transaction object

gettransactions (*addresslist, addresses_per_request=5*)

Get all transactions for each address in addresslist

Parameters

- **addresslist** (*list, str*) – Address or list of addresses
- **addresses_per_request** (*int*) – Maximum number of addresses per request. Default is 5. Use lower setting when you experience timeouts or service request errors, or higher when possible.

Return list List of Transaction objects

getutxos (*addresslist, addresses_per_request=5*)

Get list of unspent outputs (UTXO's) per address

Parameters

- **addresslist** (*list, str*) – Address or list of addresses
- **addresses_per_request** (*int*) – Maximum number of addresses per request. Default is 5. Use lower setting when you experience timeouts or service request errors, or higher when possible.

Return dict UTXO's per address

sendrawtransaction (*rawtx*)

Push a raw transaction to the network

Parameters **rawtx** (*str*) – Raw transaction as hexstring

Return dict Send transaction result

exception `bitcoinlib.services.services.ServiceError(msg=)`
Bases: `Exception`

Submodules

bitcoinlib.db module

class `bitcoinlib.db.DbInit(databasefile='/home/docs/.bitcoinlib/database/bitcoinlib.sqlite')`
Bases: `object`

Initialize database and open session

Import data if database did not exist yet

```
class bitcoinlib.db.DbKey (**kwargs)
    Bases: sqlalchemy.ext.declarative.api.Base
```

Database definitions for keys in Sqlalchemy format

Part of a wallet, and used by transactions

A simple constructor that allows initialization from kwargs.

Sets attributes on the constructed instance using the names and values in kwargs.

Only keys that are present as attributes of the instance's class are allowed. These could be, for example, any mapped columns or relationships.

outgoing = 2

bitcoinlib.encoding module

exception bitcoinlib.encoding.EncodingError (*msg=""*)

Bases: Exception

Log and raise encoding errors

bitcoinlib.encoding.addr_bech32_to_pubkeyhash (*bech, hrp=None, as_hex=False, include_witver=False*)

Decode bech32 / segwit address to public key hash

Validate the Bech32 string, and determine HRP and data

Parameters

- **bech** (*str*) – Bech32 address to convert
- **hrp** (*str*) – Address prefix called Human-readable part. Default is None and tries to derive prefix, for bitcoin specify ‘bc’ and for bitcoin testnet ‘tb’
- **as_hex** (*bool*) – Output public key hash as hex or bytes. Default is False
- **include_witver** (*bool*) – Include witness version in output? Default is False

Return str Public Key Hash

bitcoinlib.encoding.addr_convert (*addr, prefix*)

Convert base-58 encoded address to address with another prefix

Parameters

- **addr** (*str*) – Base58 address
- **prefix** (*str, bytes*) – New address prefix

Return str New converted address

bitcoinlib.encoding.addr_to_pubkeyhash (*address, as_hex=False*)

Convert address to public key hash

Parameters

- **address** (*str*) – Crypto currency address in base-58 format
- **as_hex** (*bool*) – Output as hexstring

Return bytes, str public key hash

`bitcoinlib.encoding.change_base` (*chars*, *base_from*, *base_to*, *min_length=0*, *output_even=None*, *output_as_list=None*)

Convert input chars from one base to another.

From and to base can be any base. If base is not found a array of index numbers will be returned

Examples: > `change_base('FF', 16, 10)` will return 256 > `change_base(100, 16, 2048)` will return [100]

Parameters

- **chars** (*any*) – Input string
- **base_from** (*int*, *str*) – Base number or name from input
- **base_to** (*int*, *str*) – Base number or name for output
- **min_length** (*int*) – Minimal output length. Required for decimal, advised for all output to avoid leading zeros conversion problems.
- **output_even** (*bool*) – Specify if output must contain a even number of characters. Sometimes handy for hex conversions.
- **output_as_list** (*bool*) – Always output as list instead of string.

Return str, list Base converted input as string or list.

`bitcoinlib.encoding.convert_der_sig` (*s*, *as_hex=True*)

Convert DER encoded signature to signature

Parameters

- **s** (*bytes*) – DER signature
- **as_hex** (*bool*) – Output as hexstring

Return bytes, str Signature

`bitcoinlib.encoding.convertbits` (*data*, *frombits*, *tobits*, *pad=True*)

'General power-of-2 base conversion'

Source: <https://github.com/sipa/bech32/tree/master/ref/python>

Parameters

- **data** (*list*) – Data values to convert
- **frombits** (*int*) – Number of bits in source data
- **tobits** (*int*) – Number of bits in result data
- **pad** (*bool*) – Use padding zero's or not. Default is True

Return list Converted values

`bitcoinlib.encoding.int_to_varbyteint` (*inp*)

Convert integer to CompactSize Variable length integer in byte format.

See https://en.bitcoin.it/wiki/Protocol_documentation#Variable_length_integer for specification

Parameters inp (*int*) – Integer to convert

Returns byteint: 1-9 byte representation as integer

`bitcoinlib.encoding.normalize_string` (*txt*)

Normalize a string to the default NFKD unicode format See https://en.wikipedia.org/wiki/Unicode_equivalence#Normalization

Parameters txt (*bytes*, *bytearray*, *str*) – string value

Returns string

`bitcoinlib.encoding.normalize_var` (*var*, *base=256*)

For Python 2 convert variable to string For Python 3 convert to bytes Convert decimals to integer type

Parameters

- **var** (*str*, *byte*, *bytearray*, *unicode*) – input variable in any format
- **base** (*int*) – specify variable format, i.e. 10 for decimal, 16 for hex

Returns Normalized var in string for Python 2, bytes for Python 3, decimal for base10

`bitcoinlib.encoding.pubkeyhash_to_addr` (*pkh*, *versionbyte=b'\x00'*)

Convert public key hash to address

Parameters

- **pkh** (*bytes*, *str*) – Public key hash
- **versionbyte** (*bytes*) – Prefix version byte of network, default is bitcoin “

Return str Base-58 encoded address

`bitcoinlib.encoding.pubkeyhash_to_addr_bech32` (*pubkeyhash*, *hrp='bc'*, *witver=0*, *separator='1'*)

Encode public key hash as bech32 segwit address

Format of address is prefix/hrp + separator + bech32 address + checksum

For more information see BIP173 proposal at <https://github.com/bitcoin/bips/blob/master/bip-0173.mediawiki>

Parameters

- **pubkeyhash** (*str*, *bytes*) – Public key hash
- **hrp** (*str*) – Address prefix called Human-readable part. Default is ‘bc’ an abbreviation of Bitcoin. Use ‘tb’ for testnet.
- **witver** (*int*) – Witness version between 0 and 16
- **separator** (*str*) – Separator char between hrp and data, should always be left to ‘1’ otherwise its not standard.

Return str Bech32 encoded address

`bitcoinlib.encoding.script_to_pubkeyhash` (*script*)

Creates a RIPEMD-160 hash of a locking, unlocking, redeemscript, etc

Parameters **script** (*bytes*) – Script

Return bytes RIPEMD-160 hash of script

`bitcoinlib.encoding.to_bytearray` (*s*)

Convert String, Unicode or Bytes to Python 2 and 3 compatible ByteArray :param s: String, Unicode, Bytes or ByteArray

Returns ByteArray

`bitcoinlib.encoding.to_bytes` (*s*, *unhexlify=True*)

Convert String, Unicode or ByteArray to Bytes

Parameters

- **s** (*str*, *unicode*, *bytes*, *bytearray*) – String to convert
- **unhexlify** (*bool*) – Try to unhexlify hexstring

Returns Bytes var

`bitcoinlib.encoding.to_hexstring` (*var*)

Convert Bytes or ByteArray to hexadecimal string

Parameters *var* (*bytes*, *bytearray*, *str*) – Variable to convert to hex string

Returns hexstring

`bitcoinlib.encoding.varbyteint_to_int` (*byteint*)

Convert CompactSize Variable length integer in byte format to integer.

See https://en.bitcoin.it/wiki/Protocol_documentation#Variable_length_integer for specification

Parameters *byteint* (*bytes*, *list*, *bytearray*) – 1-9 byte representation

Return int normal integer

`bitcoinlib.encoding.varstr` (*s*)

Convert string to bytestring preceded with length byte

Parameters *s* (*bytes*, *str*) – bytestring

Return bytes varstring

bitcoinlib.keys module

```
class bitcoinlib.keys.Address (data="", hashed_data="", network='bitcoin', prefix=None,
                               script_type=None, encoding=None, witness_type=None, net-
                               work_overrides=None)
```

Bases: object

Class to store, convert and analyse various address types as representation of public keys or scripts hashes

Initialize an Address object. Specify a public key, redeemscript or a hash.

Parameters

- **data** (*str*, *bytes*) – Public key, redeem script or other type of script.
- **hashed_data** (*str*, *bytes*) – Hash of a public key or script. Will be generated if ‘data’ parameter is provided
- **network** (*str*, *Network*) – Bitcoin, testnet, litecoin or other network
- **prefix** (*str*, *bytes*) – Address prefix. Use default network / script_type prefix if not provided
- **script_type** (*str*) – Type of script, i.e. p2sh or p2pkh.
- **encoding** (*str*) – Address encoding. Default is base58 encoding, for native segwit addresses specify bech32 encoding
- **witness_type** (*str*) – Specify ‘legacy’, ‘segwit’ or ‘p2sh-segwit’. Legacy for old-style bitcoin addresses, segwit for native segwit addresses and p2sh-segwit for segwit embedded in a p2sh script. Leave empty to derive automatically from script type if possible
- **network_overrides** (*dict*) – Override network settings for specific prefixes, i.e.: {“prefix_address_p2sh”: “32”}. Used by settings in providers.json

```
classmethod import_address (address, network=None, network_overrides=None)
```

Import an address to the Address class. Specify network if available, otherwise it will be derived from the address.

Parameters

- **address** (*str*) – Address to import

- **network** (*str*) – Bitcoin, testnet, litecoin or other network
- **network_overrides** (*dict*) – Override network settings for specific prefixes, i.e.: {"prefix_address_p2sh": "32"}. Used by settings in providers.json

Return Address

with_prefix (*prefix*)

Convert address using another prefix

Parameters prefix (*str, bytes*) – Address prefix

Return str Converted address

exception bitcoinlib.keys.**BKeyError** (*msg=""*)

Bases: Exception

Handle Key class Exceptions

class bitcoinlib.keys.**HDKey** (*import_key=None, key=None, chain=None, depth=0, parent_fingerprint=b'x00x00x00x00', child_index=0, isprivate=True, network=None, key_type='bip32', passphrase="", compressed=True*)

Bases: object

Class for Hierarchical Deterministic keys as defined in BIP0032

Besides a private or public key a HD Key has a chain code, allowing to create a structure of related keys.

The structure and key-path are defined in BIP0043 and BIP0044.

Hierarchical Deterministic Key class init function. If no import_key is specified a key will be generated with systems cryptographically random function. Import key can be any format normal or HD key (extended key) accepted by get_key_format. If a normal key with no chain part is provided, an chain with only 32 0-bytes will be used.

Parameters

- **import_key** (*str, bytes, int, bytearray*) – HD Key to import in WIF format or as byte with key (32 bytes) and chain (32 bytes)
- **key** (*bytes*) – Private or public key (length 32)
- **chain** (*bytes*) – A chain code (length 32)
- **depth** (*int*) – Level of depth in BIP32 key path
- **parent_fingerprint** (*bytes*) – 4-byte fingerprint of parent
- **child_index** (*int*) – Index number of child as integer
- **isprivate** (*bool*) – True for private, False for public key. Default is True
- **network** (*str, Network*) – Network name. Derived from import_key if possible
- **key_type** (*str*) – HD BIP32 or normal Private Key. Default is 'bip32'
- **passphrase** (*str*) – Optional passphrase if imported key is password protected
- **compressed** (*bool*) – Is key compressed or not, default is True

Return HDKey

account_key (*account_id=0, purpose=44, set_network=None*)

Derive account BIP44 key for current master key

Parameters

- **account_id** (*int*) – Account ID. Leave empty for account 0
- **purpose** (*int*) – BIP standard used, i.e. 44 for default, 45 for multisig
- **set_network** (*str*) – Derive account key for different network. Please note this calls the `network_change` method and changes the network for current key!

Return HDKey

account_multisig_key (*account_id=0, purpose=45, set_network=None*)

Derives a multisig account key according to BIP44/45 definition. Wrapper for the ‘`account_key`’ method.

Parameters

- **account_id** (*int*) – Account ID. Leave empty for account 0
- **purpose** (*int*) – BIP standard used, leave empty for 45 which is the default for multisig
- **set_network** (*str*) – Derive account key for different network. Please note this calls the `network_change` method and changes the network for current key!

Return HDKey

child_private (*index=0, hardened=False, network=None*)

Use Child Key Derivation (CDK) to derive child private key of current HD Key object.

Parameters

- **index** (*int*) – Key index number
- **hardened** (*bool*) – Specify if key must be hardened (True) or normal (False)
- **network** (*str*) – Network name.

Return HDKey HD Key class object

child_public (*index=0, network=None*)

Use Child Key Derivation to derive child public key of current HD Key object.

Parameters

- **index** (*int*) – Key index number
- **network** (*str*) – Network name.

Return HDKey HD Key class object

dict ()

Returns key information as dictionary

fingerprint ()

Get fingerprint of keys public part

Return bytes

static from_passphrase (*password=”, network='bitcoin'*)

Create key from Mnemonic passphrase

Parameters

- **passphrase** (*str*) – Mnemonic passphrase, list of words as string separated with a space character
- **password** (*str*) – Password to protect passphrase
- **network** (*str, Network*) – Network to use

Return HDKey

static from_seed (*key_type='bip32', network='bitcoin'*)

Used by class init function, import key from seed

Parameters

- **import_seed** (*str, bytes*) – Private key seed as bytes or hexstring
- **key_type** (*str*) – Specify type of key, default is BIP32
- **network** (*str, Network*) – Network to use

Return HDKey

info ()

Prints key information to standard output

network_change (*new_network*)

Change network for current key

Parameters new_network (*str*) – Name of new network

Return bool True

public ()

Public version of current private key.

Return HDKey

subkey_for_path (*path, network=None*)

Determine subkey for HD Key for given path. Path format: m / purpose' / coin_type' / account' / change / address_index Example: m/44'/0'/0'/0/2 See BIP0044 bitcoin proposal for more explanation.

Parameters

- **path** (*str*) – BIP0044 key path
- **network** (*str*) – Network name.

Return HDKey HD Key class object of subkey

wif (*public=None, child_index=None, prefix=None*)

Get Extended WIF of current key

Parameters

- **public** (*bool*) – Return public key?
- **child_index** (*int*) – Change child index of output WIF key
- **prefix** (*str, bytes*) – Specify version prefix in hexstring or bytes. Normally doesn't need to be specified, method uses default prefix from network settings

Return str Base58 encoded WIF key

wif_public (*prefix=None*)

Get Extended WIF public key

Parameters prefix (*str, bytes*) – Specify version prefix in hexstring or bytes. Normally doesn't need to be specified, method uses default prefix from network settings

Return str Base58 encoded WIF key

class bitcoinlib.keys.**Key** (*import_key=None, network=None, compressed=True, passphrase="", is_private=None*)

Bases: object

Class to generate, import and convert public cryptographic key pairs used for bitcoin.

If no key is specified when creating class a cryptographically secure Private Key is generated using the `os.urandom()` function.

Initialize a Key object. Import key can be in WIF, bytes, hexstring, etc. If a private key is imported a public key will be derived. If a public is imported the private key data will be empty.

Both compressed and uncompressed key version is available, the `Key.compressed` boolean attribute tells if the original imported key was compressed or not.

Parameters

- **import_key** (*str, int, bytes, bytearray*) – If specified import given private or public key. If not specified a new private key is generated.
- **network** (*str, Network*) – Bitcoin, testnet, litecoin or other network
- **compressed** (*bool*) – Is key compressed or not, default is True
- **passphrase** (*str*) – Optional passphrase if imported key is password protected
- **is_private** (*bool*) – Specify if imported key is private or public. Default is None: derive from provided key

Returns Key object

address (*compressed=None, prefix=None, script_type=None, encoding='base58'*)

Get address derived from public key

Parameters

- **compressed** (*bool*) – Always return compressed address
- **prefix** (*str, bytes*) – Specify versionbyte prefix in hexstring or bytes. Normally doesn't need to be specified, method uses default prefix from network settings
- **script_type** (*str*) – Type of script, i.e. p2sh or p2pkh.
- **encoding** (*str*) – Address encoding. Default is base58 encoding, for segwit you can specify bech32 encoding

Return str Base58 encoded address

address_uncompressed (*prefix=None*)

Get uncompressed address from public key

Parameters prefix (*str, bytes*) – Specify versionbyte prefix in hexstring or bytes. Normally doesn't need to be specified, method uses default prefix from network settings

Return str Base58 encoded address

bip38_encrypt (*passphrase*)

BIP0038 non-ec-multiply encryption. Returns BIP0038 encrypted privkey. Based on code from <https://github.com/nomorecoin/python-bip38-testing>

Parameters passphrase (*str*) – Required passphrase for encryption

Return str BIP38 passphrase encrypted private key

hash160 ()

Get public key in Hash160 format

Return bytes Hash160 of public key

info ()

Prints key information to standard output

public (*return_compressed=None*)

Get public key

Parameters **return_compressed** (*bool*) – If True always return a compressed version and if False always return uncompressed

Return str Public key hexstring

public_point ()

Get public key point on Elliptic curve

Return tuple (x, y) point

public_uncompressed ()

Get public key, uncompressed version

Return str Uncompressed public key hexstring

wif (*prefix=None*)

Get Private Key in Wallet Import Format, steps: # Convert to Binary and add 0x80 hex # Calculate Double SHA256 and add as checksum to end of key

Parameters **prefix** (*str, bytes*) – Specify versionbyte prefix in hexstring or bytes. Normally doesn't need to be specified, method uses default prefix from network settings

Return str Base58Check encoded Private Key WIF

`bitcoinlib.keys.check_network_and_key` (*key, network=None, kf_networks=None, default_network='bitcoin'*)

Check if given key corresponds with given network and return network if it does. If no network is specified this method tries to extract the network from the key. If no network can be extracted from the key the default network will be returned.

A `KeyError` will be raised if key does not corresponds with network or if multiple network are found.

Parameters

- **key** (*str, int, bytes, bytearray*) – Key in any format recognized by `get_key_format` function
- **network** (*str*) – Optional network. Method raises `KeyError` if keys belongs to another network
- **kf_networks** (*list*) – Optional list of networks which is returned by `get_key_format`. If left empty the `get_key_format` function will be called.
- **default_network** (*str*) – Specify different default network, leave empty for default (bitcoin)

Return str Network name

`bitcoinlib.keys.deserialize_address` (*address, encoding=None, network=None*)

Deserialize address. Calculate public key hash and try to determine script type and network.

The 'network' dictionary item with contain the network with highest priority if multiple networks are found. Same applies for the script type.

Specify the network argument if known to avoid unexpected results.

If more networks and or script types are found you can find these in the 'networks' field.

Parameters

- **address** (*str*) – A base58 or bech32 encoded address

- **encoding** (*str*) – Encoding scheme used for address encoding. Attempts to guess encoding if not specified.
- **network** (*str*) – Bitcoin, testnet, litecoin or other network

Return dict with information about this address

`bitcoinlib.keys.ec_point` (*p*)

Method for elliptic curve multiplication

Parameters *p* – A point on the elliptic curve

Return Point Point multiplied by generator G

`bitcoinlib.keys.get_key_format` (*key, isprivate=None*)

Determines the type (private or public), format and network key.

This method does not validate if a key is valid.

Parameters

- **key** (*str, int, bytes, bytearray*) – Any private or public key
- **isprivate** (*bool*) – Is key private or not?

Return dict Dictionary with format, network and isprivate

bitcoinlib.main module

bitcoinlib.mnemonic module

class `bitcoinlib.mnemonic.Mnemonic` (*language='english'*)

Bases: `object`

Class to convert, generate and parse Mnemonic sentences

Implementation of BIP0039 for Mnemonics passphrases

Took some parts from Pavol Rusnak Trezors implementation, see <https://github.com/trezor/python-mnemonic>

Init Mnemonic class and read wordlist of specified language

Parameters **language** (*str*) – use specific wordlist, i.e. chinese, dutch (in development), english, french, italian, japanese or spanish. Leave empty for default 'english'

static `checksum()`

Calculates checksum for given data key

Parameters **data** (*bytes, hexstring*) – key string

Return str Checksum of key in bits

static `detect_language()`

Detect language of given phrase

Parameters **words** (*str*) – List of space separated words

Return str Language

generate (*strength=128, add_checksum=True*)

Generate a random Mnemonic key

Uses cryptographically secure `os.urandom()` function to generate data. Then creates a Mnemonic sentence with the 'to_mnemonic' method.

Parameters

- **strength** (*int*) – Key strength in number of bits, default is 128 bits. It advised to specify 128 bits or more, i.e.: 128, 256, 512 or 1024
- **add_checksum** (*bool*) – Included a checksum? Default is True

Return str Mnemonic passphrase consisting of a space separated list of words

sanitize_mnemonic (*words*)

Check and convert list of words to utf-8 encoding.

Raises an error if unrecognised word is found

Parameters words (*str*) – List of space separated words

Return str Sanitized list of words

to_entropy (*words, includes_checksum=True*)

Convert Mnemonic words back to key data entropy

Parameters

- **words** (*str*) – Mnemonic words as string of list of words
- **includes_checksum** (*bool*) – Boolean to specify if checksum is used. Default is True

Return bytes Entrophy seed

to_mnemonic (*data, add_checksum=True*)

Convert key data entropy to Mnemonic sentence

Parameters

- **data** (*bytes, hexstring*) – Key data entropy
- **add_checksum** (*bool*) – Included a checksum? Default is True

Return str Mnemonic passphrase consisting of a space separated list of words

to_seed (*words, password=""*)

Use Mnemonic words and password to create a PBKDF2 seed (Password-Based Key Derivation Function 2)

First use ‘sanitize_mnemonic’ to determine language and validate and check words

Parameters

- **words** (*str*) – Mnemonic passphrase as string with space separated words
- **password** (*str*) – A password to protect key, leave empty to disable

Return bytes PBKDF2 seed

word (*index*)

Get word from wordlist

Parameters index (*int*) – word index ID

Return str A word from the dictionary

wordlist ()

Get full selected wordlist. A wordlist is selected when initializing Mnemonic class

Return list Full list with 2048 words

bitcoinlib.networks module

class bitcoinlib.networks.**Network** (*network_name='bitcoin'*)

Bases: object

Network class with all network definitions.

Prefixes for WIF, P2SH keys, HD public and private keys, addresses. A currency symbol and type, the denominator (such as satoshi) and a BIP0044 cointype.

print_value (*value*)

Return the value as string with currency symbol

Parameters *value* (*int*, *float*) – Value in smallest denominator such as Satoshi

Return str

exception bitcoinlib.networks.**NetworkError** (*msg=""*)

Bases: Exception

Network Exception class

bitcoinlib.networks.**network_by_value** (*field*, *value*)

Return all networks for field and (prefix) value.

For Example: network_by_value('prefix_wif', 'B0')

Returns: ['litecoin']

Parameters

- **field** (*str*) – Prefix name from networks definitions (networks.json)
- **value** (*str*, *bytes*) – Value of network prefix

Return list Of network name strings

bitcoinlib.networks.**network_defined** (*network*)

Is network defined?

Networks of this library are defined in networks.json in the operating systems user path.

Parameters *network* (*str*) – Network name

Return bool

bitcoinlib.networks.**network_values_for** (*field*, *output_as='default'*)

Return all prefixes mentioned field, i.e.: prefix_wif, prefix_address_p2sh, prefix_hdkey_public, etc

Parameters

- **field** (*str*) – Prefix name from networks definitions (networks.json)
- **output_as** (*str*) – Output as string or hexstring. Default is string or hexstring depending on field type.

Return str

bitcoinlib.networks.**read_network_definitions** ()

Returns network definitions from json file in settings dir

Return dict Network definitions

bitcoinlib.transactions module

```
class bitcoinlib.transactions.Input (prev_hash, output_n, keys=None, signatures=None,
                                     public_hash=b'', unlocking_script=b'', unlock-
                                     ing_script_unsigned=None, script_type=None, ad-
                                     dress='', sequence=4294967295, compressed=True,
                                     sigs_required=None, sort=False, index_n=0, value=0,
                                     double_spend=False, locktime_cltv=None, lock-
                                     time_csv=None, witness_type=None, encoding=None,
                                     network='bitcoin')
```

Bases: object

Transaction Input class, used by Transaction class

An Input contains a reference to an UTXO or Unspent Transaction Output (prev_hash + output_n). To spent the UTXO an unlocking script can be included to prove ownership.

Inputs are verified by the Transaction class.

Create a new transaction input

Parameters

- **prev_hash** (*bytes, hexstring*) – Transaction hash of the UTXO (previous output) which will be spent.
- **output_n** (*bytes, int*) – Output number in previous transaction.
- **keys** (*list (bytes, str)*) – A list of Key objects or public / private key string in various formats. If no list is provided but a bytes or string variable, a list with one item will be created. Optional
- **signatures** (*bytes, str*) – Specify optional signatures
- **public_hash** (*bytes, str*) – Public key or script hash. Specify if key is not available
- **unlocking_script** (*bytes, hexstring*) – Unlocking script (scriptSig) to prove ownership. Optional
- **script_type** (*str*) – Type of unlocking script used, i.e. p2pkh or p2sh_multisig. Default is p2pkh
- **sequence** (*bytes, int*) – Sequence part of input, you normally do not have to touch this
- **compressed** (*bool*) – Use compressed or uncompressed public keys. Default is compressed
- **sigs_required** (*int*) – Number of signatures required for a p2sh_multisig unlocking script
- **sort** (*boolean*) – Sort public keys according to BIP0045 standard. Default is False to avoid unexpected change of key order.
- **index_n** (*int*) – Index of input in transaction. Used by Transaction class.
- **value** (*int*) – Value of input in smallest denominator, i.e. sathosis
- **double_spend** (*bool*) – Is this input also spend in another transaction
- **locktime_cltv** (*int*) – Check Lock Time Verify value. Script level absolute time lock for this input
- **locktime_csv** (*int*) – Check Sequency Verify value.

- **witness_type** (*str*) – Specify witness/signature position: ‘segwit’ or ‘legacy’. Determine from script, address or encoding if not specified.
- **encoding** (*str*) – Address encoding used. For example bech32/base32 or base58. Leave empty for default
- **network** (*str*, *Network*) – Network, leave empty for default

dict ()

Get transaction input information in json format

Return dict Json with output_n, prev_hash, output_n, type, address, public_key, public_hash, unlocking_script and sequence

sequence_timelock_blocks (*blocks*)

sequence_timelock_time (*seconds*)

update_scripts (*hash_type=1*)

Method to update Input scripts.

Creates or updates unlocking script, witness script for segwit inputs, multisig redeemscripts and locktime scripts. This method is called when initializing a Input class or when signing an input.

Parameters hash_type (*int*) – Specific hash type, default is SIGHASH_ALL

Return bool Always returns True when method is completed

```
class bitcoinlib.transactions.Output (value, address="", public_hash="", public_key="",
                                       lock_script="", spent=False, output_n=0,
                                       script_type=None, encoding='base58', network='bitcoin')
```

Bases: object

Transaction Output class, normally part of Transaction class.

Contains the amount and destination of a transaction.

Create a new transaction output

An transaction outputs locks the specified amount to a public key. Anyone with the private key can unlock this output.

The transaction output class contains an amount and the destination which can be provided either as address, public key, public key hash or a locking script. Only one needs to be provided as they all can be derived from each other, but you can provide as much attributes as you know to improve speed.

Parameters

- **value** (*int*) – Amount of output in smallest denominator of currency, for example satoshi’s for bitcoins
- **address** (*str*) – Destination address of output. Leave empty to derive from other attributes you provide.
- **public_hash** (*bytes*, *str*) – Hash of public key or script
- **public_key** (*bytes*, *str*) – Destination public key
- **lock_script** (*bytes*, *str*) – Locking script of output. If not provided a default unlocking script will be provided with a public key hash.
- **spent** (*bool*) – Is output already spent? Default is False
- **output_n** (*int*) – Output index number, default is 0. Index number has to be unique per transaction and 0 for first output, 1 for second, etc

- **script_type** (*str*) – Script type of output (p2pkh, p2sh, segwit p2wpkh, etc). Extracted from lock_script if provided.
- **encoding** (*str*) – Address encoding used. For example bech32/base32 or base58. Leave empty for default
- **network** (*str*, *Network*) – Network, leave empty for default

dict ()

Get transaction output information in json format

Return dict Json with amount, locking script, public key, public key hash and address

```
class bitcoinlib.transactions.Transaction (inputs=None, outputs=None, lock-
time=0, version=1, network='bitcoin',
fee=None, fee_per_kb=None, size=None,
hash="", date=None, confirmations=None,
block_height=None, block_hash=None, in-
put_total=0, output_total=0, rawtx="", sta-
tus='new', coinbase=False, verified=False,
witness_type='legacy', flag=None)
```

Bases: object

Transaction Class

Contains 1 or more Input class object with UTXO's to spent and 1 or more Output class objects with destinations. Besides the transaction class contains a locktime and version.

Inputs and outputs can be included when creating the transaction, or can be add later with add_input and add_output respectively.

A verify method is available to check if the transaction Inputs have valid unlocking scripts.

Each input in the transaction can be signed with the sign method provided a valid private key.

Create a new transaction class with provided inputs and outputs.

You can also create a empty transaction and add input and outputs later.

To verify and sign transactions all inputs and outputs need to be included in transaction. Any modification after signing makes the transaction invalid.

Return type

Parameters

- **inputs** (*Input*, *list*) – Array of Input objects. Leave empty to add later
- **outputs** (*Output*, *list*) – Array of Output object. Leave empty to add later
- **locktime** (*int*) – Transaction level locktime. Locks the transaction until a specified block (value from 1 to 5 million) or until a certain time (Timestamp in seconds after 1-jan-1970). Default value is 0 for transactions without locktime
- **version** (*bytes*, *int*) – Version rules. Defaults to 1 in bytes
- **network** (*str*, *Network*) – Network, leave empty for default network
- **fee** (*int*) – Fee in smallest denominator (ie Satoshi) for complete transaction
- **fee_per_kb** (*int*) – Fee in smallest denominator per kilobyte. Specify when exact transaction size is not known.

:param size: Transaction size in bytes :type size: int :param date: Confirmation date of transaction :type date: datetime.datetime :param confirmations: Number of confirmations :type confirmations: int :param block_height: Block number which includes transaction :type block_height: int :param block_hash: Hash of

block for this transaction :type block_hash: str :param input_total: Total value of inputs :type input_total: int :param output_total: Total value of outputs :type output_total: int :param rawtx: Raw hexstring of complete transaction :type rawtx: str :param status: Transaction status, for example: 'new', 'incomplete', 'unconfirmed', 'confirmed' :type status: str :param coinbase: Coinbase transaction or not? :type coinbase: bool :param verified: Is transaction successfully verified? Updated when verified() method is called :type verified: bool :param witness_type: Specify witness/signature position: 'segwit' or 'legacy'. Determine from script, address or encoding if not specified. :type witness_type: str :param flag: Transaction flag to indicate version, for example for SegWit :type flag: bytes, str

add_input (*prev_hash*, *output_n*, *keys=None*, *signatures=None*, *public_hash=b"*, *unlocking_script=b"*, *unlocking_script_unsigned=None*, *script_type=None*, *address="*, *sequence=4294967295*, *compressed=True*, *sigs_required=None*, *sort=False*, *index_n=None*, *value=None*, *double_spend=False*, *locktime_cltv=None*, *locktime_csv=None*, *witness_type=None*, *encoding=None*)

Add input to this transaction

Wrapper for append method of Input class.

Parameters

- **prev_hash** (*bytes*, *hexstring*) – Transaction hash of the UTXO (previous output) which will be spent.
- **output_n** (*bytes*, *int*) – Output number in previous transaction.
- **keys** (*bytes*, *str*) – Public keys can be provided to construct an Unlocking script. Optional
- **signatures** (*bytes*, *str*) – Add signatures to input if already known
- **public_hash** (*bytes*, *str*) – Specify public hash from key or redeemscript if key is not available
- **unlocking_script** (*bytes*, *hexstring*) – Unlocking script (scriptSig) to prove ownership. Optional
- **unlocking_script_unsigned** (*bytes*, *str*) – TODO: find better name...
- **script_type** (*str*) – Type of unlocking script used, i.e. p2pkh or p2sh_multisig. Default is p2pkh
- **address** (*str*) – Specify address of input if known, default is to derive from key or scripts
- **sequence** (*int*, *bytes*) – Sequence part of input, you normally do not have to touch this
- **compressed** (*bool*) – Use compressed or uncompressed public keys. Default is compressed
- **sigs_required** – Number of signatures required for a p2sh_multisig unlocking script
- **sigs_required** – int
- **sort** (*boolean*) – Sort public keys according to BIP0045 standard. Default is False to avoid unexpected change of key order.
- **index_n** (*int*) – Index number of position in transaction, leave empty to add input to end of inputs list
- **value** (*int*) – Value of input
- **double_spend** (*bool*) – True if double spend is detected, depends on which service provider is selected

- **locktime_cltv** (*int*) – Check Lock Time Verify value. Script level absolute time lock for this input
- **locktime_csv** (*int*) – Check Sequency Verify value.
- **witness_type** (*str*) – Specify witness/signature position: ‘segwit’ or ‘legacy’. Determine from script, address or encoding if not specified.
- **encoding** (*str*) – Address encoding used. For example bech32/base32 or base58. Leave empty to derive from script or script type

Return int Transaction index number (*index_n*)

add_output (*value*, *address=""*, *public_hash=b"*, *public_key=b"*, *lock_script=b"*, *spent=False*, *output_n=None*, *encoding=None*)

Add an output to this transaction

Wrapper for the append method of the Output class.

Parameters

- **value** (*int*) – Value of output in smallest denominator of currency, for example satoshi’s for bitcoins
- **address** (*str*) – Destination address of output. Leave empty to derive from other attributes you provide.
- **public_hash** (*bytes*, *str*) – Hash of public key or script
- **public_key** (*bytes*, *str*) – Destination public key
- **lock_script** (*bytes*, *str*) – Locking script of output. If not provided a default unlocking script will be provided with a public key hash.
- **spent** (*bool*) – Has output been spent in new transaction?
- **output_n** (*int*) – Index number of output in transaction
- **encoding** (*str*) – Address encoding used. For example bech32/base32 or base58. Leave empty for to derive from script or script type

Return int Transaction output number (*output_n*)

calculate_fee ()

Get fee for this transaction in smallest denominator (i.e. Satoshi) based on its size and the transaction.*fee_per_kb* value

Return int Estimated transaction fee

dict ()

Return Json dictionary with transaction information: Inputs, outputs, version and locktime

Return dict

estimate_size (*add_change_output=True*)

Get estimated size in bytes for current transaction based on transaction type and number of inputs and outputs.

Parameters **add_change_output** (*bool*) – Assume an extra change output will be created but has not been created yet.

Return int Estimated transaction size

static import_raw (*network='bitcoin'*)

Import a raw transaction and create a Transaction object

Uses the `_transaction_deserialize` method to parse the raw transaction and then calls the `init` method of this transaction class to create the transaction object

Parameters

- **rawtx** (*bytes*, *str*) – Raw transaction string
- **network** (*str*, *Network*) – Network, leave empty for default

Return Transaction

info ()

Prints transaction information to standard output

raw (*sign_id=None*, *hash_type=1*)

Serialize raw transaction

Return transaction with signed inputs if signatures are available

Parameters

- **sign_id** (*int*) – Create raw transaction which can be signed by transaction with this input ID
- **hash_type** (*int*) – Specific hash type, default is SIGHASH_ALL

Return bytes

raw_hex (*sign_id=None*, *hash_type=1*)

Wrapper for raw method. Return current raw transaction hex

Parameters

- **sign_id** (*int*) – Create raw transaction which can be signed by transaction with this input ID
- **hash_type** (*int*) – Specific hash type, default is SIGHASH_ALL

Return hexstring

sign (*keys=None*, *tid=None*, *multisig_key_n=None*, *hash_type=1*)

Sign the transaction input with provided private key

Parameters

- **keys** (*HDKey*, *Key*, *bytes*, *list*) – A private key or list of private keys
- **tid** (*int*) – Index of transaction input
- **multisig_key_n** (*int*) – Index number of key for multisig input for segwit transactions. Leave empty if not known. If not specified all possibilities will be checked
- **hash_type** (*int*) – Specific hash type, default is SIGHASH_ALL

Return int Return int with number of signatures added

signature (*sign_id*, *hash_type=1*, *sig_version=0*)

signature_hash (*sign_id*, *hash_type=1*, *sig_version=0*)

update_totals ()

Update `input_total`, `output_total` and `fee` according to inputs and outputs of this transaction

Return int

verify ()

Verify all inputs of a transaction, check if signatures match public key.

Does not check if UTXO is valid or has already been spent

Return bool True if enough signatures provided and if all signatures are valid

exception `bitcoinlib.transactions.TransactionError` (*msg=""*)

Bases: `Exception`

Handle Transaction class Exceptions

`bitcoinlib.transactions.get_unlocking_script_type` (*locking_script_type*, *witness_type='legacy'*, *sig=False*) *wit-multi-*

Specify locking script type and get corresponding script type for unlocking script.

Parameters

- **locking_script_type** (*str*) – Locking script type. I.e.: p2pkh, p2sh, p2wpkh, p2wsh
- **witness_type** (*str*) – Type of witness: legacy or segwit. Default is legacy
- **multisig** (*bool*) – Is multisig script or not? Default is False

Return str Unlocking script type such as sig_pubkey or p2sh_multisig

`bitcoinlib.transactions.script_add_locktime_cltv` (*locktime_cltv*, *script*)

`bitcoinlib.transactions.script_add_locktime_csv` (*locktime_csv*, *script*)

`bitcoinlib.transactions.script_deserialize` (*script*, *script_types=None*, *locking_script=None*, *size_bytes_check=True*)

Deserialize a script: determine type, number of signatures and script data.

Parameters

- **script** (*str*, *bytes*, *bytearray*) – Raw script
- **script_types** (*list*) – Limit script type determination to this list. Leave to default None to search in all script types.
- **locking_script** (*bool*) – Only deserialize locking scripts. Specify False to only deserialize for unlocking scripts. Default is None for both
- **size_bytes_check** (*bool*) – Check if script or signature starts with size bytes and remove size bytes before parsing. Default is True

Return list With this items: [script_type, data, number_of_sigs_n, number_of_sigs_m]

`bitcoinlib.transactions.script_deserialize_sigpk` (*script*)

Deserialize a unlocking script (scriptSig) with a signature and public key. The DER encoded signature is decoded to a normal signature with point x and y in 64 bytes total.

Returns signature and public key.

Parameters **script** (*bytes*) – A unlocking script

Return tuple Tuple with a signature and public key in bytes

`bitcoinlib.transactions.script_to_string` (*script*)

Convert script to human readable string format with OP-codes, signatures, keys, etc

Example: “OP_DUP OP_HASH160 af8e14a2cecd715c363b3a72b55b59a31e2acac9 OP_EQUALVERIFY OP_CHECKSIG”

Parameters **script** (*bytes*, *str*) – A locking or unlocking script

Return str

`bitcoinlib.transactions.serialize_multisig_redeemscript` (*key_list*, *n_required=None*, *compressed=True*)

Create a multisig redeemscript used in a p2sh.

Contains the number of signatures, followed by the list of public keys and the OP-code for the number of signatures required.

Parameters

- **key_list** (*Key*, *list*) – List of public keys
- **n_required** (*int*) – Number of required signatures
- **compressed** (*bool*) – Use compressed public keys?

Return bytes A multisig redeemscript

`bitcoinlib.transactions.verify_signature` (*transaction_to_sign*, *signature*, *public_key*)
Verify if signatures signs provided transaction hash and corresponds with public key

Parameters

- **transaction_to_sign** (*bytes*, *str*) – Raw transaction to sign
- **signature** (*bytes*, *str*) – A signature
- **public_key** (*bytes*, *str*) – The public key

Return bool Return True if verified

bitcoinlib.wallets module

class `bitcoinlib.wallets.HDWallet` (*wallet*, *databasefile='/home/docs/bitcoinlib/database/bitcoinlib.sqlite'*, *session=None*, *main_key_object=None*)

Bases: `object`

Class to create and manage keys Using the BIP0044 Hierarchical Deterministic wallet definitions, so you can use one Masterkey to generate as much child keys as you want in a structured manner.

You can import keys in many format such as WIF or extended WIF, bytes, hexstring, seeds or private key integer. For the Bitcoin network, Litecoin or any other network you define in the settings.

Easily send and receive transactions. Compose transactions automatically or select unspent outputs.

Each wallet name must be unique and can contain only one cointype and purpose, but practically unlimited accounts and addresses.

Open a wallet with given ID or name

Parameters

- **wallet** (*int*, *str*) – Wallet name or ID
- **databasefile** (*str*) – Location of database file. Leave empty to use default
- **session** (*sqlalchemy.orm.session.Session*) – Sqlalchemy session
- **main_key_object** (*HDKey*) – Pass main key object to save time

account (*account_id*)

Returns wallet key of specific BIP44 account.

Account keys have a BIP44 path depth of 3 and have the format `m/purpose'/network'/account'`

I.e: Use `account(0).key().wif_public()` to get wallet's public account key

Parameters `account_id` (*int*) – ID of account. Default is 0

Return `HDWalletKey`

accounts (*network=None*)

Get list of accounts for this wallet

Parameters `network` (*str*) – Network name filter

Return list List of accounts as `HDWalletKey` objects

addresslist (*account_id=None, used=None, network=None, change=None, depth=5, key_id=None*)

Get list of addresses defined in current wallet

Parameters

- `account_id` (*int*) – Account ID
- `used` (*bool, None*) – Only return used or unused keys
- `network` (*str*) – Network name filter
- `change` – Only include change addresses or not. Default is `None` which returns both
- `depth` (*int*) – Filter by key depth
- `key_id` (*int*) – Key ID to get address of just 1 key

Return list List of address strings

balance (*account_id=None, network=None, as_string=False*)

Get total of unspent outputs

Parameters

- `account_id` (*int*) – Account ID filter
- `network` (*str*) – Network name. Leave empty for default network
- `as_string` (*boolean*) – Set `True` to return a string in currency format. Default returns float.

Return float, str Key balance

balance_update_from_serviceprovider (*account_id=None, network=None*)

Update balance of current account addresses using default `Service` objects `getbalance` method. Update total wallet balance in database.

Please Note: Does not update UTXO's or the balance per key! For this use the 'updatebalance' method instead

Parameters

- `account_id` (*int*) – Account ID. Leave empty for default account
- `network` (*str*) – Network name. Leave empty for default network

Return int Total balance

classmethod create (*name, key="", owner="", network=None, account_id=0, purpose=44, scheme='bip44', parent_id=None, sort_keys=True, password="", witness_type='legacy', encoding=None, databasefile=None*)

Create `HDWallet` and insert in database. Generate masterkey or import key when specified.

Please mention `account_id` if you are using multiple accounts.

Parameters

- **name** (*str*) – Unique name of this Wallet
- **key** (*str, bytes, int, bytearray*) – Masterkey to use for this wallet. Will be automatically created if not specified. Can contain all key formats accepted by the HDKey object, a HDKey object or BIP39 passphrase
- **owner** (*str*) – Wallet owner for your own reference
- **network** (*str*) – Network name, use default if not specified
- **account_id** (*int*) – Account ID, default is 0
- **purpose** (*int*) – BIP44 purpose field, default is 44
- **scheme** (*str*) – Key structure type, i.e. BIP44, single or multisig
- **parent_id** (*int*) – Parent Wallet ID used for multisig wallet structures
- **sort_keys** (*bool*) – Sort keys according to BIP45 standard (used for multisig keys)
- **password** (*str*) – Password to protect passphrase, only used if a passphrase is supplied in the ‘key’ argument.
- **witness_type** (*str*) – Specify witness type, default is ‘legacy’. Use ‘segwit’ for native segregated witness wallet, or ‘p2sh-segwit’ for legacy compatible wallets
- **encoding** (*str*) – Encoding used for address generation: base58 or bech32. Default is derive from wallet and/or witness type
- **databasefile** (*str*) – Location of database file. Leave empty to use default

Return HDWallet

```
classmethod create_multisig (name, key_list, sigs_required=None, owner="", network=None,
                             account_id=0, purpose=45, multisig_compressed=True,
                             sort_keys=True, witness_type='legacy', encoding=None,
                             databasefile=None)
```

Create a multisig wallet with specified name and list of keys. The list of keys can contain 2 or more public or private keys. For every key a cosigner wallet will be created with a BIP44 key structure or a single key depending on the key_type.

Parameters

- **name** (*str*) – Unique name of this Wallet
- **key_list** (*list*) – List of keys in HDKey format or any other format supported by HDKey class
- **sigs_required** (*int*) – Number of signatures required for validation. For example 2 for 2-of-3 multisignature. Default is all keys must signed
- **network** (*str*) – Network name, use default if not specified
- **account_id** (*int*) – Account ID, default is 0
- **purpose** (*int*) – BIP44 purpose field, default is 44
- **multisig_compressed** (*bool*) – Use compressed multisig keys for this wallet. Default is True
- **sort_keys** (*bool*) – Sort keys according to BIP45 standard (used for multisig keys)
- **witness_type** (*str*) – Specify wallet type, default is legacy. Use ‘segwit’ for segregated witness wallet.
- **encoding** (*str*) – Encoding used for address generation: base58 or bech32. Default is derive from wallet and/or witness type

- **databasefile** (*str*) – Location of database file. Leave empty to use default

Return HDWallet

dict (*detail=3*)

Return wallet information in dictionary format

Parameters detail (*int*) – Level of detail to show, can be 0, 1, 2 or 3

Return dict

get_key (*account_id=None, network=None, number_of_keys=1, change=0, depth_of_keys=5*)

Get a unused key or create a new one if there are no unused keys. Returns a key from this wallet which has no transactions linked to it.

Parameters

- **account_id** (*int*) – Account ID. Default is last used or created account ID.
- **network** (*str*) – Network name. Leave empty for default network
- **number_of_keys** (*int*) – Number of keys to return. Default is 1
- **change** (*int*) – Payment (0) or change key (1). Default is 0
- **depth_of_keys** (*int*) – Depth of account keys. Default is 5 according to BIP44 standards

Return HDWalletKey

get_key_change (*account_id=None, network=None, number_of_keys=1, depth_of_keys=5*)

Get a unused change key or create a new one if there are no unused keys. Wrapper for the `get_key` method

Parameters

- **account_id** (*int*) – Account ID. Default is last used or created account ID.
- **network** (*str*) – Network name. Leave empty for default network
- **number_of_keys** (*int*) – Number of keys to return. Default is 1
- **depth_of_keys** (*int*) – Depth of account keys. Default is 5 according to BIP44 standards

Return HDWalletKey

get_keys (*account_id=None, network=None, change=0, depth_of_keys=5*)

Get a unused key or create a new one if there are no unused keys. Returns a key from this wallet which has no transactions linked to it.

Parameters

- **account_id** (*int*) – Account ID. Default is last used or created account ID.
- **network** (*str*) – Network name. Leave empty for default network
- **change** (*int*) – Payment (0) or change key (1). Default is 0
- **depth_of_keys** (*int*) – Depth of account keys. Default is 5 according to BIP44 standards

Return HDWalletKey

import_key (*key, account_id=0, name="", network=None, purpose=44, key_type=None*)

Add new single key to wallet.

Parameters

- **key** (*str*, *bytes*, *int*, *bytearray*) – Key to import
- **account_id** (*int*) – Account ID. Default is last used or created account ID.
- **name** (*str*) – Specify name for key, leave empty for default
- **network** (*str*) – Network name, method will try to extract from key if not specified. Raises warning if network could not be detected
- **purpose** (*int*) – BIP definition used, default is BIP44
- **key_type** (*str*) – Key type of imported key, can be single (unrelated to wallet, bip32, bip44 or master for new or extra master key import. Default is 'single'

Return HDWalletKey

import_master_key (*hdkey*, *name*='Masterkey (imported)')

Import (another) masterkey in this wallet

Parameters

- **hdkey** (*HDKey*, *str*) – Private key
- **name** (*str*) – Key name of masterkey

Return HDKey Main key as HDKey object

info (*detail*=3)

Prints wallet information to standard output

Parameters detail (*int*) – Level of detail to show. Specify a number between 0 and 4, with 0 low detail and 4 highest detail

key (*term*)

Return single key with given ID or name as HDWalletKey object

Parameters term (*int*, *str*) – Search term can be key ID, key address, key WIF or key name

Return HDWalletKey Single key as object

key_add_private (*wallet_key*, *private_key*)

Change public key in wallet to private key in current HDWallet object and in database

Parameters

- **wallet_key** (*HDWalletKey*) – Key object of wallet
- **private_key** (*HDKey*, *str*) – Private key wif or HDKey object

Return HDWalletKey

key_for_path (*path*, *name*="", *account_id*=0, *change*=0, *enable_checks*=True)

Create key with specified path. Can be used to create non-default (non-BIP0044) paths.

Can cause problems if already used account ID's or address indexes are provided.

Parameters

- **path** (*str*) – Path string in m/#!/### format. With quote (') or (p/P/h/H) character for hardened child key derivation
- **name** (*str*) – Key name to use
- **account_id** (*int*) – Account ID
- **change** (*int*) – Change 0 or 1

- **enable_checks** (*bool*) – Use checks for valid BIP0044 path, default is True

Return HDWalletKey

keys (*account_id=None, name=None, key_id=None, change=None, depth=None, used=None, is_private=None, has_balance=None, is_active=True, network=None, as_dict=False*)
Search for keys in database. Include 0 or more of *account_id*, *name*, *key_id*, *change* and *depth*.

Returns a list of DbKey object or dictionary object if *as_dict* is True

Parameters

- **account_id** (*int*) – Search for account ID
- **name** (*str*) – Search for Name
- **key_id** (*int*) – Search for Key ID
- **change** (*int*) – Search for Change
- **depth** (*int*) – Only include keys with this depth
- **used** (*bool*) – Only return used or unused keys
- **is_private** (*bool*) – Only return private keys
- **has_balance** (*bool*) – Only include keys with a balance or without a balance, default is both
- **is_active** (*bool*) – Hide inactive keys. Only include active keys with either a balance or which are unused, default is True
- **network** (*str*) – Network name filter
- **as_dict** – Return keys as dictionary objects. Default is False: DbKey objects

Return list List of Keys

keys_accounts (*account_id=None, network=None, as_dict=False*)

Get Database records of account key(s) with for current wallet. Wrapper for the keys() method.

Parameters

- **account_id** (*int*) – Search for Account ID
- **network** (*str*) – Network name filter
- **as_dict** (*bool*) – Return as dictionary or DbKey object. Default is False: DbKey objects

Return list DbKey or dictionaries

keys_address_change (*account_id=None, used=None, network=None, as_dict=False*)

Get payment addresses (*change=1*) of specified *account_id* for current wallet. Wrapper for the keys() methods.

Parameters

- **account_id** (*int*) – Account ID
- **used** (*bool*) – Only return used or unused keys
- **network** (*str*) – Network name filter
- **as_dict** (*bool*) – Return as dictionary or DbKey object. Default is False: DbKey objects

Return list DbKey or dictionaries

keys_address_payment (*account_id=None, used=None, network=None, as_dict=False*)

Get payment addresses (change=0) of specified *account_id* for current wallet. Wrapper for the `keys()` methods.

Parameters

- **account_id** (*int*) – Account ID
- **used** (*bool*) – Only return used or unused keys
- **network** (*str*) – Network name filter
- **as_dict** (*bool*) – Return as dictionary or DbKey object. Default is False: DbKey objects

Return list DbKey or dictionaries

keys_addresses (*account_id=None, used=None, network=None, depth=5, as_dict=False*)

Get address-keys of specified *account_id* for current wallet. Wrapper for the `keys()` methods.

Parameters

- **account_id** (*int*) – Account ID
- **used** (*bool*) – Only return used or unused keys
- **network** (*str*) – Network name filter
- **depth** (*int*) – Filter by key depth. Default for BIP44 and multisig is 5
- **as_dict** (*bool*) – Return as dictionary or DbKey object. Default is False: DbKey objects

Return list DbKey or dictionaries

keys_networks (*used=None, as_dict=False*)

Get keys of defined networks for this wallet. Wrapper for the `keys()` method

Parameters

- **used** (*bool*) – Only return used or unused keys
- **as_dict** (*bool*) – Return as dictionary or DbKey object. Default is False: DbKey objects

Return list DbKey or dictionaries

name

Get wallet name

Return str

network_list (*field='network_name'*)

Wrapper for networks methods, returns a flat list with currently used networks for this wallet.

Returns list

networks ()

Get list of networks used by this wallet

Returns List of networks as dictionary

new_account (*name="", account_id=None, network=None*)

Create a new account with a childkey for payments and 1 for change.

An account key can only be created if wallet contains a masterkey.

Parameters

- **name** (*str*) – Account Name. If not specified ‘Account #’ with the `account_id` will be used
- **account_id** (*int*) – Account ID. Default is last accounts ID + 1
- **network** (*str*) – Network name. Leave empty for default network

Return HDWalletKey

new_key (*name=""*, *account_id=None*, *network=None*, *change=0*, *max_depth=5*)

Create a new HD Key derived from this wallet’s masterkey. An account will be created for this wallet with index 0 if there is no account defined yet.

Parameters

- **name** (*str*) – Key name. Does not have to be unique but if you use it at reference you might choose to enforce this. If not specified ‘Key #’ with an unique sequence number will be used
- **account_id** (*int*) – Account ID. Default is last used or created account ID.
- **network** (*str*) – Network name. Leave empty for default network
- **change** (*int*) – Change (1) or payments (0). Default is 0
- **max_depth** (*int*) – Maximum path depth. Default for BIP0044 is 5, any other value is non-standard and might cause unexpected behavior

Return HDWalletKey

new_key_change (*name=""*, *account_id=None*, *network=None*)

Create new key to receive change for a transaction. Calls `new_key` method with `change=1`.

Parameters

- **name** (*str*) – Key name. Default name is ‘Change #’ with an address index
- **account_id** (*int*) – Account ID. Default is last used or created account ID.
- **network** (*str*) – Network name. Leave empty for default network

Return HDWalletKey

owner

Get wallet Owner

Return str

scan (*scan_gap_limit=10*, *account_id=None*, *change=None*, *network=None*, *_keys_ignore=None*, *_recursion_depth=0*)

Generate new keys for this wallet and scan for UTXO’s.

Parameters

- **scan_gap_limit** (*int*) – Amount of new keys and change keys (addresses) created for this wallet
- **account_id** (*int*) – Account ID. Default is last used or created account ID.
- **change** – Filter by change addresses. Set to True to include only change addresses, False to only include regular addresses. None (default) to disable filter and include both
- **network** (*str*) – Network name. Leave empty for default network

Returns

select_inputs (*amount*, *variance=None*, *account_id=None*, *network=None*, *min_confirms=0*,
max_utxos=None, *return_input_obj=True*)
 Select available inputs for given amount

Parameters

- **amount** (*int*) – Total value of inputs to select
- **variance** (*int*) – Allowed difference in total input value. Default is dust amount of selected network.
- **account_id** (*int*) – Account ID
- **network** (*str*) – Network name. Leave empty for default network
- **min_confirms** (*int*) – Minimal confirmation needed for an UTXO before it will included in inputs. Default is 0 confirmations. Option is ignored if *input_arr* is provided.
- **max_utxos** (*int*) – Maximum number of UTXO's to use. Set to 1 for optimal privacy. Default is None: No maximum
- **return_input_obj** (*bool*) – Return inputs as Input class object. Default is True

Return Input, dict Selected inputs as dict or Input object

send (*output_arr*, *input_arr=None*, *account_id=None*, *network=None*, *fee=None*, *min_confirms=0*,
priv_keys=None, *max_utxos=None*, *locktime=0*, *offline=False*)

Create new transaction with specified outputs and push it to the network. Inputs can be specified but if not provided they will be selected from wallets utxo's. Output array is a list of 1 or more addresses and amounts.

Parameters

- **output_arr** (*list*) – List of output tuples with address and amount. Must contain at least one item. Example: [(*'mxdLD8SAGS9fe2EeCXALDHcdTTbppMHp8N'*, 5000000)]
- **input_arr** (*list*) – List of inputs tuples with reference to a UTXO, a wallet key and value. The format is [(*tx_hash*, *output_n*, *key_id*, *value*)]
- **account_id** (*int*) – Account ID
- **network** (*str*) – Network name. Leave empty for default network
- **fee** (*int*) – Set fee manually, leave empty to calculate fees automatically. Set fees in smallest currency denominator, for example satoshi's if you are using bitcoins
- **min_confirms** (*int*) – Minimal confirmation needed for an UTXO before it will included in inputs. Default is 0. Option is ignored if *input_arr* is provided.
- **priv_keys** (*HDKey*, *list*) – Specify extra private key if not available in this wallet
- **max_utxos** (*int*) – Maximum number of UTXO's to use. Set to 1 for optimal privacy. Default is None: No maximum
- **locktime** (*int*) – Transaction level locktime. Locks the transaction until a specified block (value from 1 to 5 million) or until a certain time (Timestamp in seconds after 1-jan-1970). Default value is 0 for transactions without locktime
- **offline** (*bool*) – Just return the transaction object and do not send it when offline = True. Default is False

Return HDWalletTransaction

send_to (*to_address*, *amount*, *account_id=None*, *network=None*, *fee=None*, *min_confirms=0*, *priv_keys=None*, *locktime=0*, *offline=False*)

Create transaction and send it with default Service objects senddrawtransaction method

Parameters

- **to_address** (*str*) – Single output address
- **amount** (*int*) – Output is smallest denominator for this network (ie: Satoshi's for Bitcoin)
- **account_id** (*int*) – Account ID, default is last used
- **network** (*str*) – Network name. Leave empty for default network
- **fee** (*int*) – Fee to use for this transaction. Leave empty to automatically estimate.
- **min_confirms** (*int*) – Minimal confirmation needed for an UTXO before it will included in inputs. Default is 0. Option is ignored if *input_arr* is provided.
- **priv_keys** (*HDKey*, *list*) – Specify extra private key if not available in this wallet
- **locktime** (*int*) – Transaction level locktime. Locks the transaction until a specified block (value from 1 to 5 million) or until a certain time (Timestamp in seconds after 1-jan-1970). Default value is 0 for transactions without locktime
- **offline** (*bool*) – Just return the transaction object and do not send it when *offline = True*. Default is *False*

Return HDWalletTransaction

sweep (*to_address*, *account_id=None*, *input_key_id=None*, *network=None*, *max_utxos=999*, *min_confirms=0*, *fee_per_kb=None*, *locktime=0*, *offline=False*)

Sweep all unspent transaction outputs (UTXO's) and send them to one output address. Wrapper for the send method.

Parameters

- **to_address** (*str*) – Single output address
- **account_id** (*int*) – Wallet's account ID
- **input_key_id** (*int*) – Limit sweep to UTXO's with this *key_id*
- **network** (*str*) – Network name. Leave empty for default network
- **max_utxos** (*int*) – Limit maximum number of outputs to use. Default is 999
- **min_confirms** (*int*) – Minimal confirmations needed to include utxo
- **fee_per_kb** (*int*) – Fee per kilobyte transaction size, leave empty to get estimated fee costs from Service provider.
- **locktime** (*int*) – Transaction level locktime. Locks the transaction until a specified block (value from 1 to 5 million) or until a certain time (Timestamp in seconds after 1-jan-1970). Default value is 0 for transactions without locktime
- **offline** (*bool*) – Just return the transaction object and do not send it when *offline = True*. Default is *False*

Return HDWalletTransaction

transaction_create (*output_arr*, *input_arr=None*, *account_id=None*, *network=None*, *fee=None*, *min_confirms=0*, *max_utxos=None*, *locktime=0*)

Create new transaction with specified outputs. Inputs can be specified but if not provided they will be selected from wallets utxo's. Output array is a list of 1 or more addresses and amounts.

Parameters

- **output_arr** (*list*) – List of output tuples with address and amount. Must contain at least one item. Example: [(‘mxdLD8SAGS9fe2EeCXALDHcdTTbppMHP8N’, 5000000)]
- **input_arr** (*list*) – List of inputs tuples with reference to a UTXO, a wallet key and value. The format is [(tx_hash, output_n, key_ids, value, signatures, unlocking_script, address)]
- **account_id** (*int*) – Account ID
- **network** (*str*) – Network name. Leave empty for default network
- **fee** (*int*) – Set fee manually, leave empty to calculate fees automatically. Set fees in smallest currency denominator, for example satoshi’s if you are using bitcoins
- **min_confirms** (*int*) – Minimal confirmation needed for an UTXO before it will included in inputs. Default is 0 confirmations. Option is ignored if input_arr is provided.
- **max_utxos** (*int*) – Maximum number of UTXO’s to use. Set to 1 for optimal privacy. Default is None: No maximum
- **locktime** (*int*) – Transaction level locktime. Locks the transaction until a specified block (value from 1 to 5 million) or until a certain time (Timestamp in seconds after 1-jan-1970). Default value is 0 for transactions without locktime

Return HDWalletTransaction object

transaction_import (*t*)

Import a Transaction into this wallet. Link inputs to wallet keys if possible and return HDWalletTransaction object. Only imports Transaction objects or dictionaries, use transaction_import_raw method to import a raw transaction.

Parameters **t** (*Transaction, dict*) – A Transaction object or dictionary

Return HDWalletTransaction

transaction_import_raw (*raw_tx, network=None*)

Import a raw transaction. Link inputs to wallet keys if possible and return HDWalletTransaction object

Parameters

- **raw_tx** (*str, bytes*) – Raw transaction
- **network** (*str*) – Network name. Leave empty for default network

Return HDWalletTransaction

transactions (*account_id=None, network=None, include_new=False, key_id=None*)**Parameters**

- **account_id** (*int*) – Filter by Account ID. Leave empty for default account_id
- **network** (*str*) – Filter by network name. Leave empty for default network
- **include_new** (*bool*) – Also include new and incomplete transactions in list. Default is False
- **key_id** (*int*) – Filter by key ID

Return list List of transactions as dictionary

transactions_update (*account_id=None, used=None, network=None, key_id=None, depth=None, change=None*)

Update wallets transaction from service providers. Get all transactions for known keys in this wallet. The balances and unspent outputs (UTXO's) are updated as well, but for large wallets use the `utxo_update` method if possible.

Parameters

- **account_id** (*int*) – Account ID
- **used** (*bool, None*) – Only update used or unused keys, specify `None` to update both. Default is `None`
- **network** (*str*) – Network name. Leave empty for default network
- **key_id** (*int*) – Key ID to just update 1 key
- **depth** (*int*) – Only update keys with this depth, default is depth 5 according to BIP0048 standard. Set depth to `None` to update all keys of this wallet.
- **change** (*int*) – Only update change or normal keys, default is both (`None`)

Return bool True if all transactions are updated

utxo_add (*address, value, tx_hash, output_n, confirmations=0, script=""*)

Add a single UTXO to the wallet database. To update all utxo's use `utxos_update` method.

Use this method for testing, offline wallets or if you wish to override standard method of retrieving UTXO's

This method does not check if UTXO exists or is still spendable.

```
[{ 'address': 'n2S9Czehjvdpwd2YqekxuUC1Tz5ZdK3YN', 'script': '', 'confirmations': 10, 'output_n': 1, 'tx_hash': '9df91f89a3eb4259ce04af66ad4caf3c9a297feea5e0b3bc506898b6728c5003', 'value': 8970937 } ]
```

Parameters

- **address** (*str*) – Address of Unspent Output. Address should be available in wallet
- **value** (*int*) – Value of output in sathosis or smallest denominator for type of currency
- **tx_hash** (*str*) – Transaction hash or previous output as hex-string
- **output_n** (*int*) – Output number of previous transaction output
- **confirmations** (*int*) – Number of confirmations. Default is 0, unconfirmed
- **script** (*str*) – Locking script of previous output as hex-string

Return int Number of new UTXO's added, so 1 if successful

utxos (*account_id=None, network=None, min_confirms=0, key_id=None*)

Get UTXO's (Unspent Outputs) from database. Use `utxos_update` method first for updated values

Parameters

- **account_id** (*int*) – Account ID
- **network** (*str*) – Network name. Leave empty for default network
- **min_confirms** (*int*) – Minimal confirmation needed to include in output list
- **key_id** (*int*) – Key ID to just get 1 key

Return list List of transactions

utxos_update (*account_id=None, used=None, networks=None, key_id=None, depth=None, change=None, utxos=None, update_balance=True*)

Update UTXO's (Unspent Outputs) in database of given account using the default Service object.

Delete old UTXO's which are spent and append new UTXO's to database.

For usage on an offline PC, you can import utxos with the utxos parameter as a list of dictionaries: [{

```
    'address': 'n2S9Czehjydmppwd2YqekxuUC1Tz5ZdK3YN', 'script': '', 'confirmations': 10,
    'output_n': 1, 'tx_hash': '9df91f89a3eb4259ce04af66ad4caf3c9a297feca5e0b3bc506898b6728c5003',
    'value': 8970937
```

}]

Parameters

- **account_id** (*int*) – Account ID
- **used** (*bool*) – Only check for UTXO for used or unused keys. Default is both
- **networks** (*str, list*) – Network name filter as string or list of strings. Leave empty to update all used networks in wallet
- **key_id** (*int*) – Key ID to just update 1 key
- **depth** (*int*) – Only update keys with this depth, default is depth 5 according to BIP0048 standard. Set depth to None to update all keys of this wallet.
- **change** (*int*) – Only update change or normal keys, default is both (None)
- **utxos** (*list*) – List of unspent outputs in dictionary format specified in this method DOC header
- **update_balance** (*bool*) – Option to disable balance update after fetching UTXO's, used when utxos_update method is called several times in a row. Default is True

Return int Number of new UTXO's added

class bitcoinlib.wallets.**HDWalletKey** (*key_id, session, hdkey_object=None*)

Bases: object

Normally only used as attribute of HDWallet class. Contains HDKey object and extra information such as path and balance.

All HDWalletKey are stored in a database

Initialize HDWalletKey with specified ID, get information from database.

Parameters

- **key_id** (*int*) – ID of key as mentioned in database
- **session** (*sqlalchemy.orm.session.Session*) – Required SQLAlchemy Session object
- **hdkey_object** (*HDKey*) – Optional HDKey object. Specify HDKey object if available for performance

balance (*fmt=""*)

Get total of unspent outputs

Parameters **fmt** (*str*) – Specify 'string' to return a string in currency format

Return float, str Key balance

dict ()

Return current key information as dictionary

static from_key (*wallet_id*, *session*, *key*=", *account_id*=0, *network*=None, *change*=0, *purpose*=44, *parent_id*=0, *path*='m', *key_type*=None, *encoding*='base58', *witness_type*=None)

Create HDWalletKey from a HDKey object or key

Parameters

- **name** (*str*) – New key name
- **wallet_id** (*int*) – ID of wallet where to store key
- **session** (*sqlalchemy.orm.session.Session*) – Required SQLAlchemy Session object
- **key** (*str*, *int*, *byte*, *bytearray*, *HDKey*) – Optional key in any format accepted by the HDKey class
- **account_id** (*int*) – Account ID for specified key, default is 0
- **network** (*str*) – Network of specified key
- **change** (*int*) – Use 0 for normal key, and 1 for change key (for returned payments)
- **purpose** (*int*) – BIP0044 purpose field, default is 44
- **parent_id** (*int*) – Key ID of parent, default is 0 (no parent)
- **path** (*str*) – BIP0044 path of given key, default is 'm' (masterkey)
- **key_type** (*str*) – Type of key, single or BIP44 type
- **encoding** (*str*) – Encoding used for address, i.e.: base58 or bech32. Default is base58
- **witness_type** (*str*) – Witness type used when creating transaction script: legacy, p2sh-segwit or segwit.

Return HDWalletKey HDWalletKey object

fullpath (*change*=None, *address_index*=None, *max_depth*=5)

Full BIP0044 key path: - m / purpose' / coin_type' / account' / change / address_index

Parameters

- **change** (*int*) – Normal = 0, change = 1
- **address_index** (*int*) – Index number of address (path depth 5)
- **max_depth** (*int*) – Maximum depth of output path. I.e. type 3 for account path

Return list Current key path

key ()

Get HDKey object for current HDWalletKey

Return HDKey

class bitcoinlib.wallets.**HDWalletTransaction** (*hdwallet*, **args*, ***kwargs*)

Bases: *bitcoinlib.transactions.Transaction*

Normally only used as attribute of HDWallet class. Child of Transaction object with extra reference to wallet and database object.

All HDWalletTransaction items are stored in a database

Initialize HDWalletTransaction object with reference to a HDWallet object

Parameters

- **hdwallet** – HDWallet object, wallet name or ID

- **args** (*args*) – Arguments for HDWallet parent class
- **kwargs** (*kwargs*) – Keyword arguments for HDWallet parent class

classmethod from_transaction (*hdwallet, t*)
Create HDWalletTransaction object from Transaction object

Parameters

- **hdwallet** (*HDwallet, str, int*) – HDWallet object, wallet name or ID
- **t** (*Transaction*) – Specify Transaction object

Return HDWalletClass

info ()
Print Wallet transaction information to standard output. Include send information.

save ()
Save this transaction to database

Return int Transaction ID

send (*offline=False*)
Verify and push transaction to network. Update UTXO's in database after successful send

Parameters offline (*bool*) – Just return the transaction object and do not send it when offline = True. Default is False

Return bool Returns True if successfully pushed to the network

sign (*keys=None, index_n=0, multisig_key_n=None, hash_type=1*)
Sign this transaction. Use existing keys from wallet or use keys argument for extra keys.

Parameters

- **keys** (*HDKey, str*) – Extra private keys to sign the transaction
- **index_n** (*int*) – Transaction index_n to sign
- **multisig_key_n** (*int*) – Index number of key for multisig input for segwit transactions. Leave empty if not known. If not specified all possibilities will be checked
- **hash_type** (*int*) – Hashtype to use, default is SIGHASH_ALL

Return bool True is successfully signed

exception bitcoinlib.wallets.**WalletError** (*msg=""*)
Bases: Exception

Handle Wallet class Exceptions

bitcoinlib.wallets.**normalize_path** (*path*)
Normalize BIP0044 key path for HD keys. Using single quotes for hardened keys

Parameters path (*str*) – BIP0044 key path

Return str Normalized BIP0044 key path with single quotes

bitcoinlib.wallets.**parse_bip44_path** (*path*)
Assumes a correct BIP0044 path and returns a dictionary with path items. See Bitcoin improvement proposals BIP0043 and BIP0044.

Specify path in this format: m / purpose' / cointype' / account' / change / address_index. Path length must be between 1 and 6 (Depth between 0 and 5)

Parameters path (*str*) – BIP0044 path as string, with backslash (/) separator.

Return dict Dictionary with path items: isprivate, purpose, cointype, account, change and address_index

bitcoinlib.wallets.**script_type_default** (*witness_type, key_type, locking_script=False*)

Determine default script type for wallet type and key type combination used in this library.

Parameters

- **witness_type** (*str*) – Type of wallet: standard or segwit
- **key_type** (*str*) – Type of keys used in this wallet
- **locking_script** (*bool*) – Limit search to locking_script. Specify False for locking scripts and True for unlocking scripts

Return str Default script type

bitcoinlib.wallets.**wallet_create_or_open** (*name, key="", owner="", network=None, account_id=0, purpose=44, scheme='bip44', parent_id=None, sort_keys=False, password="", witness_type='legacy', encoding=None, database_file='/home/docs/bitcoinlib/database/bitcoinlib.sqlite'*)

Create a wallet with specified options if it doesn't exist, otherwise just open

See Wallets class create method for option documentation

bitcoinlib.wallets.**wallet_create_or_open_multisig** (*name, key_list, sigs_required=None, owner="", network=None, account_id=0, purpose=45, multisig_compressed=True, sort_keys=True, witness_type='legacy', encoding=None, database_file='/home/docs/bitcoinlib/database/bitcoinlib.sqlite'*)

Create a wallet with specified options if it doesn't exist, otherwise just open

See Wallets class create method for option documentation

bitcoinlib.wallets.**wallet_delete** (*wallet, databasefile='/home/docs/bitcoinlib/database/bitcoinlib.sqlite', force=False*)

Delete wallet and associated keys and transactions from the database. If wallet has unspent outputs it raises a WalletError exception unless 'force=True' is specified

Parameters

- **wallet** (*int, str*) – Wallet ID as integer or Wallet Name as string
- **databasefile** (*str*) – Location of Sqlite database. Leave empty to use default
- **force** (*bool*) – If set to True wallet will be deleted even if unspent outputs are found. Default is False

Return int Number of rows deleted, so 1 if succesfull

bitcoinlib.wallets.**wallet_delete_if_exists** (*wallet, database_file='/home/docs/bitcoinlib/database/bitcoinlib.sqlite', force=False*)

Delete wallet and associated keys from the database. If wallet has unspent outputs it raises a WalletError exception unless 'force=True' is specified. If wallet wallet does not exist return False

Parameters

- **wallet** (*int, str*) – Wallet ID as integer or Wallet Name as string

- **databasefile** (*str*) – Location of Sqlite database. Leave empty to use default
- **force** (*bool*) – If set to True wallet will be deleted even if unspent outputs are found. Default is False

Return int Number of rows deleted, so 1 if succesfull

`bitcoinlib.wallets.wallet_empty(wallet, databasefile='/home/docs/.bitcoinlib/database/bitcoinlib.sqlite')`
Remove all generated keys and transactions from wallet. Does not delete the wallet itself or the masterkey, so everything can be recreated.

Parameters

- **wallet** (*int, str*) – Wallet ID as integer or Wallet Name as string
- **databasefile** (*str*) – Location of Sqlite database. Leave empty to use default

Return bool True if succesfull

`bitcoinlib.wallets.wallet_exists(wallet, databasefile='/home/docs/.bitcoinlib/database/bitcoinlib.sqlite')`
Check if Wallets is defined in database

Parameters

- **wallet** (*int, str*) – Wallet ID as integer or Wallet Name as string
- **databasefile** (*str*) – Location of Sqlite database. Leave empty to use default

Return bool True if wallet exists otherwise False

`bitcoinlib.wallets.wallets_list(databasefile='/home/docs/.bitcoinlib/database/bitcoinlib.sqlite')`
List Wallets from database

Parameters **databasefile** (*str*) – Location of Sqlite database. Leave empty to use default

Return dict Dictionary of wallets defined in database

Module contents

`bitcoinlib.tools`

Used by autodoc_mock_imports.

7.6 Script types

This is an overview script types used in transaction Input and Outputs.

They are defined in main.py

7.6.1 Locking scripts

Scripts lock funds in transaction outputs (UTXO's). Also called ScriptSig.

Lock Script	Script to Unlock	Encoding	Key type / Script	Prefix BTC
p2pkh	Pay to Public Key Hash	base58	Public key hash	1
p2sh	Pay to Script Hash	base58	Redeemscript hash	3
p2wpkh	Pay to Wallet Pub Key Hash	bech32	Public key hash	bc
p2wsh	Pay to Wallet Script Hash	bech32	Redeemscript hash	bc
multisig	Multisig Script	base58	Multisig script	3
pubkey	Public Key (obsolete)	base58	Public Key	1
nulldata	Nulldata	n/a	OP_RETURN script	n/a

7.6.2 Unlocking scripts

Scripts used in transaction inputs to unlock funds from previous outputs. Also called ScriptPubKey.

Locking sc.	Name	Unlocks	Key type / Script
sig_pubkey	Signature, Public Key	p2pkh	Sign. + Public key
p2sh_multisig	Pay to Script Hash	p2sh, multisig	Multisig + Redeemscript
p2sh_p2wpkh	Pay to Wallet Pub Key Hash	p2wpkh	PK Hash + Redeemscript
p2sh_p2wsh	Multisig script	p2wsh	Redeemscript
signature	Sig for public key (old)	pubkey	Signature

7.6.3 Bitcoinlib script support

The ‘pubkey’ lockscript and ‘signature’ unlocking script are ancient and not supported by BitcoinLib at the moment.

Using different encodings for addresses than the one listed in the Locking Script table is possible but not advised: It is not standard and not sufficiently tested.

CHAPTER 8

Disclaimer

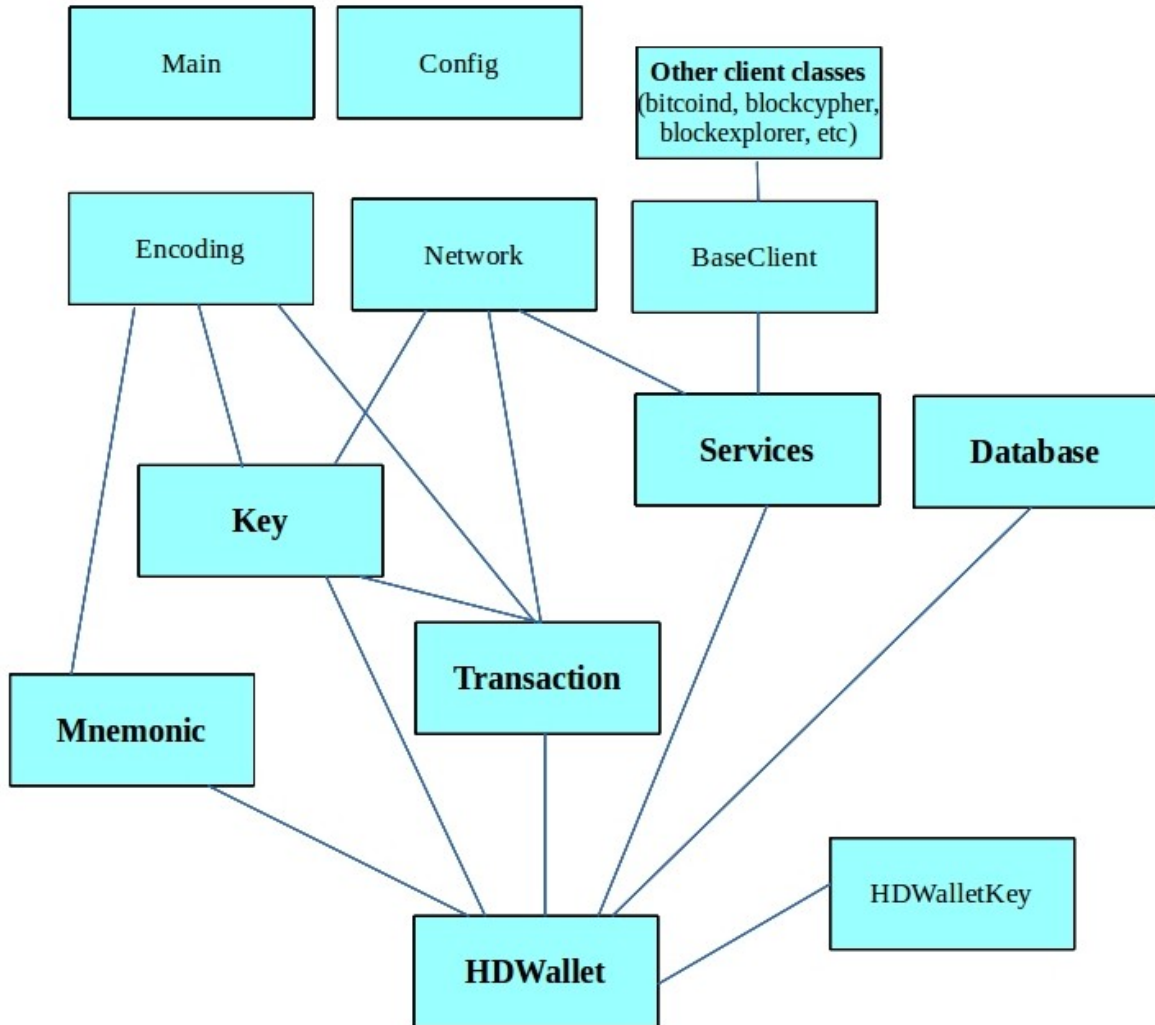

This library is still in development, please use at your own risk and test sufficiently before using it in a production environment.
