
djangotoolbox Documentation

Release latest

July 19, 2015

Djangotoolbox provides a common API for running Django on non-relational/NoSQL databases (currently via [Django-nonrel](#)).

In `djangotoolbox.db` you can find base classes for writing non-relational DB backends. Read [Writing a non-relational Django backend](#) for more information.

In `djangotoolbox.fields` you can find several common field types for non-relational DB backends (`ListField`, `SetField`, `DictField`, `RawField`, `BlobField`).

The `djangotoolbox.admin` module provides admin overrides for making `django.contrib.auth` work correctly in the admin UI. Simply add `'djangotoolbox'` to `INSTALLED_APPS` **after** `django.contrib.admin`. This will disable features that require JOINS. If you still need permission handling you should use the [nonrel permission backend](#).
