Gluon Documentation

Release 2015.1.1

Project Gluon

December 25, 2015

Contents

1 User Documentation **3**
- 1.1 Getting Started . . . 3
- 1.2 Site . . . 5
- 1.3 x86 support . . . 15
- 1.4 Frequently Asked Questions . . . 15

2 Features **17**
- 2.1 Config Mode . . . 17
- 2.2 Autoupdater . . . 17
- 2.3 Private WLAN . . . 18
- 2.4 Mesh on WAN . . . 19
- 2.5 Announcing Node Information . . . 19
- 2.6 Adding SSH public keys . . . 22
- 2.7 Roles . . . 22

3 Developer Documentation **23**
- 3.1 Development Basics . . . 23
- 3.2 Adding support for new hardware . . . 24
- 3.3 Upgrade scripts . . . 25
- 3.4 Config Mode . . . 26
- 3.5 WAN support . . . 28
- 3.6 Internationalization support . . . 28

4 Releases **31**
- 4.1 Gluon 2015.1.1 . . . 31
- 4.2 Gluon 2015.1 . . . 31
- 4.3 Gluon 2014.4 . . . 36
- 4.4 Gluon 2014.3.1 . . . 39
- 4.5 Gluon 2014.3 . . . 39

5 Supported Devices & Architectures **43**
- 5.1 ar71xx-generic . . . 43
- 5.2 ar71xx-nand . . . 44
- 5.3 mpc85xx-generic . . . 45
- 5.4 x86-generic . . . 45
- 5.5 x86-kvm_guest . . . 45

6 License **47**

7 Indices and tables 49

Gluon is a modular framework for creating OpenWrt-based firmwares for wireless mesh nodes. Several Freifunk communities in Germany use Gluon as the foundation of their Freifunk firmwares.

CHAPTER 1

User Documentation

1.1 Getting Started

1.1.1 Selecting the right version

Gluon's releases are managed using Git tags. If you're a community getting started with Gluon we recommend to use the latest stable release of Gluon.

Take a look at the list of gluon releases and notice the latest release, e.g. *v2014.3*.

Please keep in mind that a matching site configuration for your community is required. Due to new features being added (or sometimes being removed) the format of the site configuration changes slightly between releases.

Recent releases (starting with *v2014.3.1*) will come with an example configuration located in *docs/site-example/*.

1.1.2 Dependencies

To build Gluon, several packages need to be installed on the system. On a freshly installed Debian Wheezy system the following packages are required:

- *git* (to get Gluon and other dependencies)
- *subversion*
- *build-essential*
- *gawk*
- *unzip*
- *libncurses-dev* (actually *libncurses5-dev*)
- *libz-dev* (actually *zlib1g-dev*)

1.1.3 Building the images

To build Gluon, first check out the repository. Replace *RELEASE* with the version you'd like to checkout, e.g. *v2015.1*.

```
git clone https://github.com/freifunk-gluon/gluon.git gluon -b RELEASE
```

This command will create a directory named *gluon/*. It might also tell a scary message about being in a *detached state*. **Don't panic!** Everything's fine. Now, enter the freshly created directory:

```
cd gluon
```

It's time to add (or create) your site configuration. So let's create the directory *site/*:

```
mkdir site
cd site
```

Copy *site.conf*, *site.mk* and *i18n* from *docs/site-example*:

```
cp ../docs/site-example/site.conf .
cp ../docs/site-example/site.mk .
cp -r ../docs/site-example/i18n .
```

Edit these files to match your community, then go back to the top-level Gluon directory and build Gluon:

```
cd ..
make update                          # Get other repositories used by Gluon
make GLUON_TARGET=ar71xx-generic     # Build Gluon
```

When calling make, the OpenWrt build environment is prepared/updated. In case of errors read the messages carefully and try to fix the stated issues (e.g. install tools not available yet).

`ar71xx-generic` is the most common target and will generated images for most of the supported hardware. To see a complete list of supported targets, call `make` without setting `GLUON_TARGET`.

The built images can be found in the directory *images*. Of these, the factory images are to be used when flashing from the original firmware a device came with, and sysupgrade is to upgrade from other versions of Gluon or any other OpenWRT-based system.

You should reserve about 10GB of disk space for each *GLUON_TARGET*.

There are two levels of *make clean*:

```
make clean GLUON_TARGET=ar71xx-generic
```

will ensure all packages are rebuilt for a single target; this is what you normally want to do after an update.

```
make dirclean
```

will clean the entire tree, so the toolchain will be rebuilt as well, which is not necessary in most cases, and will take a while.

1.1.4 Environment variables

Gluon's build process can be controlled by various environment variables.

GLUON_SITEDIR Path to the site configuration. Defaults to `site/`.

GLUON_IMAGEDIR Path where images will be stored. Defaults to `images/`.

GLUON_BUILDDIR Working directory during build. Defaults to `build/`.

So all in all, to update and rebuild a Gluon build tree, the following commands should be used (repeat the `make clean` and `make` for all targets you want to build):

```
git pull
(cd site && git pull)
make update
make clean GLUON_TARGET=ar71xx-generic
make GLUON_TARGET=ar71xx-generic
```

1.2 Site

The `site` consists of the files `site.conf` and `site.mk`. In the first community based values are defined, which both are processed during the build process and runtime. The last is directly included in the make process of Gluon.

1.2.1 Configuration

The `site.conf` is a lua dictionary with the following defined keys.

hostname_prefix A string which shall prefix the default hostname of a device.

site_name The name of your community.

site_code The code of your community. It is good practice to use the TLD of your community here.

prefix4 The IPv4 Subnet of your community mesh network in CIDR notation, e.g.

```
prefix4 = '10.111.111.0/18'
```

prefix6 The IPv6 subnet of your community mesh network, e.g.

```
prefix6 = 'fdca::ffee:babe:1::/64'
```

timezone The timezone of your community live in, e.g.

```
-- Europe/Berlin
timezone = 'CET-1CEST,M3.5.0,M10.5.0/3'
```

ntp_server List of NTP servers available in your community or used by your community, e.g.:

```
ntp_servers = {'1.ntp.services.ffeh','2.tnp.services.ffeh'}
```

opkg_repo [optional] Overwrite the default `opkg` repository server, e.g.:

```
opkg_repo = 'http://opkg.services.ffeh/attitude_adjustment/12.09/%S/packages'
```

The *%S* is a variable, which is replaced with the platform of an device during the build process.

regdom The wireless regulatory domain responsible for your area, e.g.:

```
regdom = 'DE'
```

wifi24 WLAN Configuration of your community in the 2.4Ghz radio. Consisting of `ssid` of your client network, the `channel` your community is using, `htmode`, the adhoc ssid `mesh_ssid` used between devices, the adhoc bssid `mesh_bssid` and the adhoc multicast rate `mesh_mcast_rate`. Optionally `mesh_vlan` can be used to setup VLAN on top of the 802.11 ad-hoc interface. The options `mesh_disabled` and `client_disabled` are optional, too. They allow to disable the SSID by default, e.g. for preconfigured node. This only affects first configuraton. Combined in an dictionary, e.g.:

```
wifi24 = {
  ssid = 'entenhausen.freifunk.net',
  channel = 11,
  htmode = 'HT40-',
  mesh_ssid = 'ff:ff:ff:ee:ba:be',
  mesh_bssid = 'ff:ff:ff:ee:ba:be',
  mesh_mcast_rate = 12000,
},
```

wifi5 Same as *wifi24* but for the 5Ghz radio.

next_node [package] Configuration of the local node feature of Gluon

```
next_node = {
  ip4 = '10.23.42.1',
  ip6 = 'fdca:ffee:babe:1::1',
  mac = 'ca:ff:ee:ba:be:00'
}
```

fastd_mesh_vpn Remote server setup for the fastd-based mesh VPN.

The *enabled* option can be set to true to enable the VPN by default.

If *configurable* is *false* or unset, the method list will be replaced on updates with the list in the site configuration. Setting *configurable* to *true* will allow the user to add the method `null` to the front of the method list or remove `null` from it, and make this change survive updates. Settings configurable is necessary for the package *gluon-luci-mesh-vpn-fastd*, which adds a UI for this configuration.

In any case, the `null` method should always be the first method in the list if it is supported at all. You should only set *configurable* to *true* if the configured peers support both the `null` method and methods with encryption.

```
fastd_mesh_vpn = {
  methods = {'salsa2012+umac'},
  -- enabled = true,
  -- configurable = true,
  mtu = 1426,
  groups = {
    backbone = {
      limit = 2,
      peers = {
        peer1 = {
          key = 'XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX',
          remotes = {'ipv4 "vpn1.entenhausen.freifunk.net" port 10000'},
        },
      }
    }
  }
}
```

mesh_on_wan [optional] Enables the mesh on the WAN port (`true` or `false`).

mesh_on_lan [optional] Enables the mesh on the LAN port (`true` or `false`).

autoupdater [package] Configuration for the autoupdater feature of Gluon.

```
autoupdater = {
  branch = 'experimental',
  branches = {
    stable = {
      name = 'stable',
      mirrors = {
        'http://[fdca:ffee:babe:1::fec1]/firmware/stable/sysupgrade/',
        'http://[fdca:ffee:babe:1::fec2]/firmware/stable/sysupgrade/',
      },
      probability = 0.08,
      good_signatures = 2,
      pubkeys = {
        'XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX', -- someguy
        'XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX', -- someother
      }
    }
```

```
    }
  }
```

roles [optional] Optional role definitions. With this nodes will announce their role inside the mesh. In the backend this adds the facility to distinguish between normal, backbone and service nodes or even gateways (if they advertise the role, also). It is up to the community which roles to define. See the section below as an example. `default` takes the default role which is set initially. This value should be part of `list`. If you want node owners to change the role via config mode add the package `gluon-luci-node-role` to `site.mk`.

The strings to display in the LuCI interface can be configured per language in the `i18n/en.po`, `i18n/de.po`, etc. files of the site repository using message IDs like `gluon-luci-node-role:role:node` and `gluon-luci-node-role:role:backbone`.

```
  roles = {
    default = 'node',
    list = {
      'node',
      'test',
      'backbone',
      'service',
    },
  },
```

simple_tc [package] Uplink traffic control, ingress and egress values are specified in kbit/s.

```
  simple_tc = {
    mesh_vpn = {
      ifname = 'mesh-vpn',
      enabled = false,
      limit_egress = 200,
      limit_ingress = 3000,
    },
  },
```

setup_mode [package] Allows skipping setup mode (config mode) at first boot when attribute `skip` is set to `true`. This is optional and may be left out.

```
  setup_mode = {
    skip = true,
  },
```

legacy [package] Configuration for the legacy upgrade path. This is only required in communities upgrading from Lübeck's LFF-0.3.x.

```
  legacy = {
        version_files = {'/etc/.freifunk_version_keep', '/etc/.eff_version_keep'},
        old_files = {'/etc/config/config_mode', '/etc/config/ffeh', '/etc/config/freifunk'},
        config_mode_configs = {'config_mode', 'ffeh', 'freifunk'},
        fastd_configs = {'ffeh_mesh_vpn', 'mesh_vpn'},
        mesh_ifname = 'freifunk',
        tc_configs = {'ffki', 'freifunk'},
        wifi_names = {'wifi_freifunk', 'wifi_freifunk5', 'wifi_mesh', 'wifi_mesh5'},
  }
```

1.2.2 Packages

The `site.mk` is a Makefile which should define constants involved in the build process of Gluon.

GLUON_SITE_PACKAGES Defines a list of packages which should installed additional to the `gluon_core` package.

GLUON_RELEASE The current release version Gluon should use.

GLUON_PRIORITY The default priority for the generated manifests (see the autoupdater documentation for more information).

GLUON_LANGS List of languages (as two-letter-codes) to include for the web interface. Should always contain `en`.

1.2.3 Config mode texts

The community-defined texts in the config mode are configured in PO files in the `i18n` subdirectory of the site configuration. The message IDs currently defined are:

gluon-config-mode:welcome Welcome text on the top of the config wizard page.

gluon-config-mode:pubkey Information about the public VPN key on the reboot page.

gluon-config-mode:reboot General information about the reboot page.

There is a POT file in the site example directory which can be used to create templates for the language files. The command `msginit -l en -i ../../docs/site-example/i18n/gluon-site.pot` can be used from the `i18n` directory to create an initial PO file called `en.po` if the `gettext` utilities are installed.

1.2.4 Examples

site.mk

```
##        gluon site.mk makefile example

##        GLUON_SITE_PACKAGES
#                specify gluon/openwrt packages to include here
#                The gluon-mesh-batman-adv-* package must come first because of the dependency resolu

GLUON_SITE_PACKAGES := \
        gluon-mesh-batman-adv-15 \
        gluon-alfred \
        gluon-announced \
        gluon-autoupdater \
        gluon-config-mode-autoupdater \
        gluon-config-mode-contact-info \
        gluon-config-mode-core \
        gluon-config-mode-geo-location \
        gluon-config-mode-hostname \
        gluon-config-mode-mesh-vpn \
        gluon-ebtables-filter-multicast \
        gluon-ebtables-filter-ra-dhcp \
        gluon-luci-admin \
        gluon-luci-autoupdater \
        gluon-luci-portconfig \
        gluon-luci-wifi-config \
        gluon-next-node \
        gluon-mesh-vpn-fastd \
        gluon-radvd \
        gluon-setup-mode \
```

```
        gluon-status-page \
        haveged \
        iptables \
        iwinfo

##        DEFAULT_GLUON_RELEASE
#                version string to use for images
#                gluon relies on
#                        opkg compare-versions "$1" '>>' "$2"
#                to decide if a version is newer or not.

DEFAULT_GLUON_RELEASE := 0.6+exp$(shell date '+%Y%m%d')

##        GLUON_RELEASE
#                call make with custom GLUON_RELEASE flag, to use your own release version scheme.
#                e.g.:
#                        $ make images GLUON_RELEASE=23.42+5
#                would generate images named like this:
#                        gluon-ff%site_code%-23.42+5-%router_model%.bin

# Allow overriding the release number from the command line
GLUON_RELEASE ?= $(DEFAULT_GLUON_RELEASE)

# Default priority for updates.
GLUON_PRIORITY ?= 0

# Languages to include
GLUON_LANGS ?= en de
```

site.conf

```
-- This is an example site configuration for Gluon v2015.1
--
-- Take a look at the documentation located at
-- http://gluon.readthedocs.org/ for details.
--
-- This configuration will not work as it. You're required to make
-- community specific changes to it!
{
  -- Used for generated hostnames, e.g. freifunk-abcdef123456. (optional)
  -- hostname_prefix = 'freifunk-',

  -- Name of the community.
  site_name = 'Freifunk Entenhausen',

  -- Shorthand of the community.
  site_code = 'ffxx',

  -- Prefixes used within the mesh. Both are required.
  prefix4 = '10.xxx.0.0/20',
  prefix6 = 'fdxx:xxxx:xxxx::/64',

  -- Timezone of your community.
  -- See http://wiki.openwrt.org/doc/uci/system#time_zones
  timezone = 'CET-1CEST,M3.5.0,M10.5.0/3',
```

```
  -- List of NTP servers in your community.
  -- Must be reachable using IPv6!
  ntp_servers = {'1.ntp.services.ffxx'},

  -- Wireless regulatory domain of your community.
  regdom = 'DE',

  -- Wireless configuration for 2.4 GHz interfaces.
  wifi24 = {
    -- Wireless channel.
    channel = 1,

    -- ESSID used for client network.
    ssid = 'entenhausen.freifunk.net',

    -- Specifies the channel width in 802.11n and 802.11ac mode.
    -- Possible values are:
    -- HT20 (single 20MHz channel),
    -- HT40- (2x 20MHz channels, secondary below)
    -- HT40+ (2x 20MHz channels, secondary above)
    htmode = 'HT20',

    -- Adjust these values!
    mesh_ssid = 'xe:xx:xx:xx:xx:xx',  -- ESSID used for mesh
    mesh_bssid = 'xe:xx:xx:xx:xx:xx', -- BSSID used for mesh

    -- Bitrate used for multicast/broadcast packets.
    mesh_mcast_rate = 12000,

    -- (optional) mesh VLAN on 802.11 ad-hoc interface (1-4095)
    -- mesh_vlan = 14,
    -- client_disabled = true,
    -- mesh_disabled = false,
  },

  -- Wireless configuration for 5 GHz interfaces.
  -- This should be equal to the 2.4 GHz variant, except
  -- for channel and htmode.
  wifi5 = {
    ssid = 'entenhausen.freifunk.net',
    channel = 44,
    htmode = 'HT20',
    mesh_ssid = 'xx:xx:xx:xx:xx:xx',
    mesh_bssid = 'xx:xx:xx:xx:xx:xx',
    mesh_mcast_rate = 12000,
    -- mesh_vlan = 14,
    -- client_disabled = true,
    -- mesh_disabled = false,
  },

  -- The next node feature allows clients to always reach the node it is
  -- connected to using a known IP address.
  next_node = {
    -- anycast IPs of all nodes
    ip4 = '10.xxx.0.xxx',
    ip6 = 'fdxx:xxxx:xxxx::xxxx',

    -- anycast MAC of all nodes
```

```
  mac = 'xe:xx:xx:xx:xx:xx',
},

- site-ffmwu (Mainz, Wiesbaden & Umgebung)
- site-ffmyk (Mayen-Koblenz)
- site-ffm (München)
- site-ffms (Münster)
- site-ffnw (Nordwest)
- site-ffpb (Paderborn)
- site-ffka (Karlsruhe)
- site-ffrl (Rheinland)
- site-ffrg (Ruhrgebiet)
- site-ffs (Stuttgart)
- site-fftr (Trier)

1.3 x86 support

Gluon can run on normal x86 systems, for example virtual machines and VPN boxes. There is no WLAN support on x86 though.

1.3.1 Targets

There are two targets for x86 images:

x86-generic Generic x86 support with many different ethernet drivers; should run on most x86 systems.

There are three images:

- *generic* (compressed "raw" image, can written to a disk directly or booted with qemu)
- *virtualbox* (VDI image)
- *vmware* (VMDK image)

These images only differ in the image file format, the content is the same. Therefore there is only a single *x86-generic* sysupgrade image instead of three.

Please note that the *x86-generic* image doesn't include VirtIO support, so another virtual NIC like *pcnet32* must be chosen when using VirtualBox.

x86-kvm The *x86-kvm* image uses VirtIO as its harddisk and network driver.

1.4 Frequently Asked Questions

CHAPTER 2

Features

2.1 Config Mode

When in Config Mode a node will neither participate in the mesh nor connect to the VPN using the WAN port. Instead, it'll offer a web interface on the LAN port to aid configuration of the node.

Whether a node is in Config Mode can be determined by a characteristic blinking sequence of the SYS LED:

2.1.1 Activating Config Mode

Config Mode is automatically entered at the first boot. You can re-enter Config Mode by pressing and holding the RESET/WPS button for about three seconds. The device should reboot (all LEDs will turn of briefly) and Config Mode will be available.

2.1.2 Port Configuration

In general, Config Mode will be offered on the LAN ports. However, there are two practical exceptions:

- Devices with just one network port will run Config Mode on that port.
- Devices with PoE on the WAN port will run Config Mode on the WAN port instead.

2.1.3 Accessing Config Mode

Config Mode can be accessed at http://192.168.1.1. The node will offer DHCP to clients. Should this fail, you may assign an IP from 192.168.1.0/24 to your computer manually.

2.2 Autoupdater

Gluon contains an automatic update system which can be configured in the site configuration.

2.2.1 Building Images

By default, the autoupdater is disabled (as it is usually not helpful to have unexpected updates during development), but it can be enabled by setting the variable GLUON_BRANCH when building to override the default branch set in the set in the site configuration.

A manifest file for the updater can be generated with *make manifest*. A signing script (using ecdsautils) can by found in the *contrib* directory. When creating the manifest, `GLUON_PRIORITY` can be set on the command line, or it can be taken from the `site.mk`.

The priority defines the maximum number of days that may pass between releasing an update and installation of the images. The update probability with start at 0 after the release time mentioned in the manifest and then slowly rise to 1 after the number of days given by the priority has passed.

The priority may be an integer or a decimal fraction.

A fully automated nightly build could use the following commands:

```
git pull
(cd site && git pull)
make update
make clean
make -j5 GLUON_TARGET=ar71xx-generic GLUON_BRANCH=experimental
make manifest GLUON_BRANCH=experimental
contrib/sign.sh $SECRETKEY images/sysupgrade/experimental.manifest

rm -rf /where/to/put/this/experimental
cp -r images /where/to/put/this/experimental
```

2.2.2 Infrastructure

We suggest to have following directory tree accessible via http:

```
firmware/
        stable/
                sysupgrade/
                factory/
        snapshot/
                sysupgrade/
                factory/
        experimental/
                sysupgrade/
                factory/
```

The server must be available via IPv6.

2.2.3 Command Line

These commands can be used on a node.

```
# Update with some probability
autoupdater
```

```
# Force update check, even when the updater is disabled
autoupdater -f
```

2.3 Private WLAN

It is possible to set up a private WLAN that bridges the WAN port and is seperated from the mesh network. Please note that you should not enable `mesh_on_wan` simultaneously.

The private WLAN can be enabled through the config mode if the package `gluon-luci-private-wifi` is installed. You may also enable a private WLAN using the command line:

```
uci set wireless.wan_radio0=wifi-iface
uci set wireless.wan_radio0.device=radio0
uci set wireless.wan_radio0.network=wan
uci set wireless.wan_radio0.mode=ap
uci set wireless.wan_radio0.encryption=psk2
uci set wireless.wan_radio0.ssid="$SSID"
uci set wireless.wan_radio0.key="$KEY"
uci set wireless.wan_radio0.disabled=0
uci commit
wifi
```

Please replace `$SSID` by the name of the WLAN and `$KEY` by your passphrase (8-63 characters). If you have two radios (e.g. 2.4 and 5 GHz) you need to do this for radio0 and radio1.

It may also be disabled by running:

```
uci set wireless.wan_radio0.disabled=1
uci commit
wifi
```

2.4 Mesh on WAN

It's possible to enable the mesh on the WAN port like this:

```
uci set network.mesh_wan.auto=1
uci commit
```

It may also be disabled again by running:

```
uci set network.mesh_wan.auto=0
uci commit
```

2.4.1 site.conf

The optional option `mesh_on_wan` may be set to `true` (`false` is the default) to enable meshing on the WAN port without further configuration.

2.5 Announcing Node Information

Gluon is capable of announcing information about each node to the mesh and to neighbouring nodes. This allows nodes to learn each others hostname, IP addresses, location, software versions and various other information.

2.5.1 Format of collected data

Information to be announced is currently split into two categories:

nodeinfo In this category (mostly) static information is collected. If something is unlikely to change without human intervention it should be put here.

statistics This category holds fast changing data, like traffic counters, uptime, system load or the selected gateway.

Both categories will have a `node_id` key by default. It should be used to match data from *statistics* to *nodeinfo*.

2.5.2 Accessing Node Information

There are two packages responsible for distribution of the information. For one, information is distributed across the mesh using alfred. Information between neighbouring nodes is exchanged using *gluon-announced*.

alfred (mesh bound)

The package `gluon-alfred` is required for this to work.

Using alfred both categories are distributed within the mesh. In order to retrieve the data you'll need both a local alfred daemon and alfred-json installed. Please note that at least one alfred daemon is required to run as *master*.

nodeinfo is distributed as alfred datatype *158*, while *statistics* uses *159*. Both are compressed using GZip (alfred-json can handle the decompression).

In order to retrieve statistics data you could run:

```
# alfred-json -z -r 159
{
  "f8:d1:11:7e:97:dc": {
    "processes": {
      "total": 55,
      "running": 2
    },
    "idletime": 30632.290000000001,
    "uptime": 33200.07,
    "memory": {
      "free": 1660,
      "cached": 8268,
      "total": 29212,
      "buffers": 2236
    },
    "node_id": "f8d1117e97dc",
    "loadavg": 0.01
  },
  "90:f6:52:3e:b9:50": {
    "processes": {
      "total": 58,
      "running": 2
    },
    "idletime": 28047.470000000001,
    "uptime": 33307.849999999999,
    "memory": {
      "free": 2364,
      "cached": 7168,
      "total": 29212,
      "buffers": 1952
    },
    "node_id": "90f6523eb950",
    "loadavg": 0.34000000000000002
  }
}
```

You can find more information about alfred in its README.

gluon-announced

gluon-announced allows querying neighbouring nodes for their *nodeinfo*. It is a daemon listening on the multicast address `ff02::2:1001` on UDP port 1001 on the bare mesh interfaces.

gluon-neighbour-info

A programm called *gluon-neighbour-info* has been developed to retrieve information from neighbours.

```
gluon-neighbour-info -i wlan0 \
-p 1001 -d ff02:0:0:0:0:0:2:1001 \
-r nodeinfo
```

On optional timeout may be specified, e.g. *-t 5* (default: 3 seconds).

2.5.3 Adding a fact

To add a fact just add a file to either `/lib/gluon/announce/nodeinfo.d/` or `/lib/gluon/announce/statistics.d/`.

The file must contain a lua script and its name will become the key for the resulting JSON object. A simple script adding a `hostname` field might look like this:

```
return uci:get_first('system', 'system', 'hostname')
```

The directory structure will be converted to a JSON object, i.e. you may create subdirectories. So, if the directories look like this

```
.
-- hardware
|   -- model
-- hostname
-- network
|   -- mac
-- node_id
-- software
    -- firmware
```

the resulting JSON would become:

```
# /lib/gluon/announce/announce.lua nodeinfo
{
   "hardware" : {
      "model" : "TP-Link TL-MR3420 v1"
   },
   "hostname" : "mr3420-test",
   "network" : {
      "mac" : "90:f6:52:82:06:02"
   },
   "node_id" : "90f652820602",
   "software" : {
      "firmware" : {
         "base" : "gluon-v2014.2-32-ge831099",
         "release" : "0.4.1+0-exp20140720"
      }
```

```
    }
}
```

2.6 Adding SSH public keys

By using the package `gluon-authorized-keys` it is possible to add SSH public keys to an image to permit root login.

If you select this package, add a list of authorized keys to `site.conf` like this::

```
{
  authorized_keys = { 'ssh-rsa AAA.... user1@host',
                      'ssh-rsa AAA.... user2@host },
  hostname_prefix = ...
  ...
```

Existing keys in `/etc/dropbear/authorized_keys` will be preserved.

2.7 Roles

It is possible to define a set of roles you want to distinguish at backend side. One node can own one role which it will announce via alfred inside the mesh. This will make it easier to differentiate nodes when parsing alfred data. E.g to count only **normal** nodes and not the gateways or servers (nodemap). A lot of things are possible.

For this the section `roles` in `site.conf` is needed:

```
roles = {
  default = 'node',
  list = {
    node = 'Normal Node',
    test = 'Test Node',
    backbone = 'Backbone Node',
    service = 'Service Node',
  },
},
```

The value of `default` is the role every node will initially own. This value should be part of `list` as well. If you want node owners to change the defined roles via config-mode you can add the package `gluon-luci-node-role` to your `site.mk`. Then, you can select one of the defined roles from a dropdown list where the right-handed value is the one which is displayed and the left-handed key the one which is configured into the system.

The role is saved in `gluon-node-info.system.role`. To change the role using command line do:

```
uci set gluon-node-info.system.role="$ROLE"
uci commit
```

Please replace `$ROLE` by the role you want the node to own.

CHAPTER 3

Developer Documentation

3.1 Development Basics

Gluon's source is kept in git repositories at GitHub.

3.1.1 Bug Tracker

The main repo does have issues enabled.

3.1.2 IRC

Gluon's developers frequent #gluon on hackint. You're welcome to join us!

3.1.3 Working with repositories

To update the repositories used by Gluon, just adjust the commit IDs in *modules* and rerun

```
make update
```

make update also applies the patches that can be found in the directories found in *patches*; the resulting branch will be called *patched*, while the commit specified in *modules* can be refered to by the branch *base*.

```
make unpatch
```

sets the repositories to the *base* branch,

```
make patch
```

re-applies the patches by resetting the *patched* branch to *base* and calling *git am* for the patch files. Calling *make* or a similar command after calling *make unpatch* is generally not a good idea.

After new patches have been commited on top of the patched branch (or existing commits since the base commit have been edited or removed), the patch directories can be regenerated using

```
make update-patches
```

If applying a patch fails because you have changed the base commit, the repository will be reset to the old *patched* branch and you can try rebasing it onto the new *base* branch yourself and after that call *make update-patches* to fix the problem.

Always call *make update-patches* after making changes to a module repository as *make update* will overwrite your commits, making *git reflog* the only way to recover them!

3.2 Adding support for new hardware

This page will give a short overview on how to add support for new hardware to Gluon.

3.2.1 Hardware requirements

Having an ath9k (or ath10k) based WLAN adapter is highly recommended, although other chipsets may also work. VAP (multiple SSID) support is a requirement. At the moment, Gluon's scripts can't handle devices without WLAN adapters (although such environments may also be interesting, e.g. for automated testing in virtual machines).

3.2.2 Adding profiles

The vast majority of devices with ath9k WLAN uses the ar71xx target of OpenWrt. If the hardware you want to add support for is also ar71xx, adding a new profile is enough.

Profiles are defined in `targets/<target>-<subtarget>/profiles.mk`. There are two macros used to define which images are generated: `GluonProfile` and `GluonModel`. The following examples are taken from `profiles.mk` of the `ar71xx-generic` target:

```
$(eval $(call GluonProfile,TLWR1043))
$(eval $(call GluonModel,TLWR1043,tl-wr1043nd-v1-squashfs,tp-link-tl-wr1043n-nd-v1))
$(eval $(call GluonModel,TLWR1043,tl-wr1043nd-v2-squashfs,tp-link-tl-wr1043n-nd-v2))
```

The `GluonProfile` macro takes at least one parameter, the profile name as it is defined in the Makefiles of OpenWrt (`openwrt/target/linux/<target>/<subtarget>/profiles/*` and `openwrt/target/linux/<target>/image/Makefile`). If the target you are on doesn't define profiles (e.g. on x86), just add a single profile called `Generic` or similar.

It may optionally take a second parameter which defines additional packages to include for the profile (e.g. ath10k). The additional packages defined in `openwrt/target/linux/<target>/<subtarget>/profiles/*` aren't used.

The `GluonModel` macro takes three parameters: The profile name, the suffix of the image file generated by OpenWrt (without the file extension), and the final image name of the Gluon image. The final image name must be the same that is returned by the following command.

```
lua -e 'print(require("platform_info").get_image_name())'
```

This is just so the autoupdater can work. The command has to be executed _on_ the target (eg. the hardware router with a flashed image). So you'll first have to build an image with a guessed name, and afterwards build a new, correctly named image. On targets which aren't supported by the autoupdater, `require("platform_info").get_image_name()` will just return `nil` and the final image name may be defined arbitrarily.

On devices with multiple WLAN adapters, care must also be taken that the primary MAC address is configured correctly. `/lib/gluon/core/sysconfig/primary_mac` should contain the MAC address which can be found on a label on most hardware; if it does not, `/lib/gluon/upgrade/core/initial/001-sysconfig` in `gluon-core` might need a fix. (There have also been cases in which the address was incorrect even on devices with only one WLAN adapter, in these cases an OpenWrt bug was the cause).

3.2.3 Adding support for new hardware targets

Adding a new target is much more complex than adding a new profile. There are two basic steps required for adding a new target:

Adjust packages

One package that definitely needs adjustments for every new target added is `lua-platform-info`. Just start with a copy of an existing platform info script, adjust it for the new target, and add the new target to the list of supported targets in the package Makefile.

On many targets, Gluon's network setup scripts (mainly in the packages `gluon-core` and `gluon-mesh-batman-adv-core`) won't run correctly without some adjustments, so better double check that everything is fine there (and the files `primary_mac`, `lan_ifname` and `wan_ifname` in `/lib/gluon/core/sysconfig/` contain sensible values).

Add support to the build system

A directory for the new target must be created under `targets`, and it must be added to `targets/targets.mk`. In the new target directory, three files must be created:

- config
- profiles.mk
- vermagic

The file `config` can be used to add additional, target-specific options to the OpenWrt config. It must at least select the correct target and subtarget. For `profiles.mk`, see *Adding profiles*.

The files `vermagic` must have the correct content so kernel modules from the upstream repositories can be installed without dependency issues. The OpenWrt version a Gluon release is based on is defined by the upstream package repo URL in `include/gluon.mk` (in the variable `CONFIG_VERSION_REPO`); at the time this documentation was written, this was `barrier_breaker/14.07`; whenever the package repo is updated, all `vermagic` files must be updated as well.

The content is a hash which is part of the version number of the kernel package. So in the case of `ar71xx-generic` on `barrier_breaker`, we look for the kernel package in the directory `https://downloads.openwrt.org/barrier_breaker/14.07/ar71xx/generic/packages/base/`. As the kernel package is called `kernel_3.10.49-1-0114c71ed85677c9c1e4911437af4743_ar71xx.ipk`, the correct `vermagic` string is `0114c71ed85677c9c1e4911437af4743`.

After this, is should be sufficient to call `make GLUON_TARGET=<target>-<subtarget>` to build the images for the new target.

3.3 Upgrade scripts

3.3.1 Basics

After each sysupgrade (including the initial installation), Gluon will execute all scripts under `/lib/gluon/upgrade`. These scripts' filenames usually begin with a 3-digit number specifying the order of execution.

To get an overview of the ordering of all scripts of all packages, the helper script `contrib/lsupgrade.sh` in the Gluon repository can be used, which will print all upgrade scripts' filenames and directories. If executed on a TTY, the filename will be highlighted in green, the repository in blue and the package in red.

3.3.2 Best practices

- Most upgrade scripts are written in Lua. This allows using lots of helper functions provided by LuCi and Gluon, e.g. to access the site configuration or edit UCI configuration files.
- Whenever possible, scripts shouldn't check if they are running for the first time, but just edit configuration files to achive a valid configuration (without overwriting configuration changes made by the user where desirable). This allows using the same code to create the initial configuration and upgrade configurations on upgrades.
- If it is unavoidable to run different code during the initial installation, the `sysconfig.gluon_version` variable can be checked. This variable in `nil` during the initial installation and contains the previously install Gluon version otherwise. The package `gluon-legacy` (which is responsible for upgrades from the old firmwares of Hamburg/Kiel/Lübeck) uses the special value `legacy`; other packages should handle this value just as any other string.

3.3.3 Script ordering

These are some guidelines for the script numbers:

- `0xx`: Basic `sysconfig` setup
- `1xx`: Basic system setup (including basic network configuration)
- `2xx`: Wireless setup
- `3xx`: Advanced network and system setup
- `4xx`: Extended network and system setup (e.g. mesh VPN and next-node)
- `5xx`: Miscellaneous (everything not fitting into any other category)
- `6xx` .. `8xx`: Currently unused
- `9xx`: Upgrade finalization

3.4 Config Mode

As of 2014.4 *gluon-config-mode* consists of several modules.

gluon-config-mode-core This modules provides the core functionality for the config mode. All modules must depend on it.

gluon-config-mode-hostname Provides a hostname field.

gluon-config-mode-autoupdater Informs whether the autoupdater is enabled.

gluon-config-mode-mesh-vpn Allows toggling of mesh-vpn-fastd and setting a bandwidth limit.

gluon-config-mode-geo-location Enables the user to set the geographical location of the node.

gluon-config-mode-contact-info Adds a field where the user can provide contact information.

In order to get a config mode close to the one found in 2014.3.x you may add these modules to your *site.mk*: gluon-config-mode-hostname, gluon-config-mode-autoupdater, gluon-config-mode-mesh-vpn, gluon-config-mode-geo-location, gluon-config-mode-contact-info

3.4.1 Writing Config Mode Modules

Config mode modules are located at */lib/gluon/config-mode/wizard* and */lib/gluon/config-mode/reboot*. Modules are named like *0000-name.lua* and are executed in lexical order. If you take the standard set of modules, the order is, for wizard modules:

- 0050-autoupdater-info
- 0100-hostname
- 0300-mesh-vpn
- 0400-geo-location
- 0500-contact-info

While for reboot modules it is:

- 0100-mesh-vpn
- 0900-msg-reboot

Wizards

Wizard modules return a UCI section. A simple module capable of changing the hostname might look like this:

```
local cbi = require "luci.cbi"
local uci = luci.model.uci.cursor()

local M = {}

function M.section(form)
  local s = form:section(cbi.SimpleSection, nil, nil)
  local o = s:option(cbi.Value, "_hostname", "Hostname")
  o.value = uci:get_first("system", "system", "hostname")
  o.rmempty = false
  o.datatype = "hostname"
end

function M.handle(data)
  uci:set("system", uci:get_first("system", "system"), "hostname", data._hostname)
  uci:save("system")
  uci:commit("system")
end

return M
```

Reboot page

Reboot modules return a function that will be called when the page is to be rendered or nil (i.e. the module is skipped):

```
if no_hello_world_today then
  return nil
else
  return function ()
    luci.template.render_string("Hello World!")
  end
end
```

3.5 WAN support

As the WAN port of a node will be connected to a user's private network, it is essential that the node only uses the WAN when it is absolutely necessary. There are two cases in which the WAN port is used:

- Mesh VPN (package `gluon-mesh-vpn-fastd`
- DNS to resolve the VPN servers' addresses (package `gluon-wan-dnsmasq`)

After the VPN connection has been established, the node should be able to reach the mesh's DNS servers and use these for all other name resolution.

3.5.1 Routing tables

As a node may get IPv6 default routes both over the WAN and the mesh, Gluon uses two routing tables for IPv6. As all normal traffic should go over the mesh, the mesh routes are added to the default table (table 0). All routes on the WAN interface are put into table 1 (see `/lib/gluon/upgrade/110-network` in `gluon-core`).

There is also an *ip -6 rule* which routes all IPv6 traffic with a packet mark with the bit 1 set though table 1.

3.5.2 libpacketmark

libpacketmark is a library which can be loaded with `LD_PRELOAD` and will set the packet mark of all sockets created by a process in accordance with the `LIBPACKETMARK_MARK` environment variable. This allows setting the packet mark for processes which don't support this themselves. The process must run as root (or at least with `CAP_NET_ADMIN`) for this to work.

Unfortunately there's no nice way to set the packet mark via iptables for outgoing packets. The iptables will run after the packet has been created, to even when the packet mark is changed and the packet is re-routed, the source address won't be rewritten to the default source address of the newly chosen route. *libpacketmark* avoids this issue as the packet mark will already be set when the packet is created.

3.5.3 gluon-wan-dnsmasq

To separate the DNS servers in the mesh from the ones on the WAN, the `gluon-wan-dnsmasq` package provides a secondary DNS daemon which runs on `127.0.0.1:54`. It will automatically use all DNS servers explicitly configured in `/etc/config/gluon-wan-dnsmasq` or received via DNS/RA on the WAN port. It is important that no DNS servers for the WAN interface are configured in `/etc/config/network` and that `peerdns` is set to 0 so the WAN DNS servers aren't leaked to the primary DNS daemon.

libpacketmark is used to make the secondary DNS daemon send its requests over the WAN interface.

The package `gluon-mesh-vpn-fastd` provides an iptables rule which will redirect all DNS requests from processes running with the primary group `gluon-fastd` to `127.0.0.1:54`, thus making fastd use the secondary DNS daemon.

3.6 Internationalization support

3.6.1 General guidelines

- All config mode packages must be fully translatable, with complete English and German texts.
- All new expert mode packages be fully translatable. English texts are required, German texts recommended.

- Existing expert mode packages should be made translatable as soon as possible.
- The "message IDs" (which are the arguments to the `translate` function) should be the English texts.

3.6.2 i18n support in LuCI

Internationalization support can be found in the `luci.i18n` package. Strings are translated using the `i18n.translate` and `i18n.translatef` functions (`translate` for static strings, `translatef` for printf-like formatted string).

Example from the `gluon-config-mode-geo-location` package:

```
local i18n = require "luci.i18n"
o = s:option(cbi.Flag, "_location", i18n.translate("Show node on the map"))
```

3.6.3 Adding translation templates to Gluon packages

The i18n support is based on the standard gettext system. For each translatable package, a translation template with extension `.pot` can be created using the `i18n-scan.pl` script from the LuCI repository:

```
cd package/gluon-config-mode-geo-location
mkdir i18n
cd i18n
../../../packages/luci/build/i18n-scan.pl ../files > gluon-config-mode-geo-location.pot
```

The entries in the template can be reordered after the generation if desirable. Lots of standard translations like "Cancel" are already available in the LuCI base translation file (see `packages/luci/po/templates/base.pot`) and can be removed from the template.

In addition, some additions to the Makefile must be made. Instead of OpenWrt's default package.mk, the Gluon version `$(GLUONDIR)/include/package.mk` must be used. The i18n files must be installed and PKG_CONFIG_DEPENDS must be added:

```
...
include $(GLUONDIR)/include/package.mk

PKG_CONFIG_DEPENDS += $(GLUON_I18N_CONFIG)
...
define Build/Compile
  $(call GluonBuildI18N,gluon-config-mode-geo-location,i18n)
endef

define Package/gluon-config-mode-geo-location/install
  ...
  $(call GluonInstallI18N,gluon-config-mode-geo-location,$(1))
endef
...
```

3.6.4 Adding translations

A new translation file for a template can be added using the `msginit` command:

```
cd package/gluon-config-mode-geo-location/i18n
msginit -l de
```

This will create the file `de.po` in which the translations can be added.

The translation file can be updated to a new template version using the `msgmerge` command:

```
msgmerge -U de.po gluon-config-mode-geo-location.pot
```

After the merge, the translation file should be checked for "fuzzy matched" entries where the original English texts have changed. All entries from the the translation file should be translated in the `.po` file (or removed from it, so the original English texts are displayed instead).

3.6.5 Adding support for new languages

A list of all languages supported by LuCI can be found in the `include/package.mk` file of the Gluon repository. Adding translations for these languages is straightforward using the `msginit` command.

For other languages, support must be added tu LuCI first, which constitutes completely translating the `base.pot`. Please contact the upstream LuCI maintainers if you'd like to do this.

CHAPTER 4

Releases

4.1 Gluon 2015.1.1

4.1.1 Added hardware support

ar71xx-generic

- TP-Link
  - TL-WA830RE (v1)

4.1.2 New features

The *x86-generic* and *x86-kvm_guest* images now support two ethernet interfaces by default. If two interfaces exist during the first boot, *eth0* will be used as LAN and *eth1* as WAN.

4.1.3 Bugfixes

- Fix German "Expert Mode" label (was "Export Mode")
- Fix download of OpenSSL during build (because of broken OpenSSL download servers...)
- Fix ABI break causing kernel panics when trying to use network-related modules from the official OpenWrt repository (like *kmod-pppoe*)
- Fix race conditions breaking parallel build occasionally
- A broken network configuration would be generated when an older Gluon version was updated to 2015.1 with `mesh_on_lan` enabled in *site.conf*
- Minor announced/alfred JSON format fixes (don't output empty lists where empty objects would be expected)

4.2 Gluon 2015.1

4.2.1 Added hardware support

Gluon v2015.1 is the first release to officially support hardware that is not handled by the *ar71xx-generic* OpenWrt target. This also means that *ar71xx-generic* isn't the default target anymore, the `GLUON_TARGET` variable must be

set for all runs of `make` and `make clean` now.

ar71xx-generic

- Allnet
  - ALL0315N
- D-Link
  - DIR-615 (C1)
- GL-Inet
  - 6408A (v1)
  - 6416A (v1)
  - WRT160NL
- Netgear
  - WNDR3700 (v1, v2)
  - WNDR3800
  - WNDRMAC (v2)
- TP-Link
  - TL-MR3220 (v2)
  - TL-WA701N/ND (v1)
  - TL-WA860RE (v1)
  - TL-WA901N/ND (v2, v3)
  - TL-WR743N/ND (v1, v2)
  - TL-WR941N/ND (v5)
  - TL-WR2543N/ND (v1)
- Ubiquiti
  - Nanostation M XW
  - Loco M XW
  - UniFi AP Pro

ar71xx-nand

- Netgear
  - WNDR3700 (v4)
  - WNDR4300 (v1)

mpc85xx-generic

- TP-Link
  - TL-WDR4900 (v1)

x86-generic

- x86-generic
- x86-virtualbox
- x86-vmware

x86-kvm_guest

- x86-kvm

4.2.2 New features

Multilingual config mode

All config and expert mode modules contain both English and German texts now. The English locale should always be enabled in `site.mk` (as English is the fallback language), German can be enabled in addition using the `GLUON_LANGS` setting.

The language shown is autmatically determined from the headers sent by the user's browser.

Mesh-on-LAN

Gluon now supports meshing using a node's LAN ports. It can be enabled by default in *site.conf*, and configured by the user using the *gluon-luci-portconfig* expert mode package.

Please note that nodes without the *mesh-on-lan* feature enabled must never be connected via their LAN ports.

Extended WLAN configuration

The new `client_disabled` and `mesh_disabled` keys in the `wifi24` and `wifi5` sections allow to disable the client and mesh networks by default, which may make sense for images for special installations.

The new package *gluon-luci-wifi-config* allows the user to change these settings; in addition, the WLAN adapters' transmission power can be changed in this package.

fastd "performance mode"

The new package *gluon-luci-mesh-vpn-fastd* allows the user to switch between the *security* and *performance* VPN settions. In *performance mode*, the method *null* will be prepended to the method list.

The new option `configurable` in the `fastd_mesh_vpn` section of `site.conf` must be set to *true* so firmware upgrades don't overwrite the method list completely (non-*null* methods will still be overwritten). Adding the *gluon-luci-mesh-vpn-fastd* package enforces this setting.

Altitude setting in *gluon-config-mode-geo-location*

The *gluon-config-mode-geo-location* config mode module now contains an optional altitude field.

gluon-announced rework

The *gluon-announced* package has been reworked to allow querying it from anywhere in the mesh. In contrast to *gluon-alfred*, it is based on a query-response model (the master multicasts a query, the nodes respond), while *gluon-alfred* uses periodic announcements.

For now, we recommend including both *gluon-alfred* and *gluon-announced* in Gluon-based firmwares, until *gluon-announced* is ready to replace *gluon-alfred* completely, and software like the ffmap backend has been adjusted accordingly.

Nested peer groups

Nested peer groups for the *fastd-mesh-vpn-fastd* package can now be configured in `site.conf`, each with its own peer limit. This allows to add additional constaints, for example to connect to 2 peers altogether, but only 1 peer in each data center.

Autoupdater manual branch override

When running the updater manually on the command line, the branch to use can now be overridden using the `-b` option.

4.2.3 Bugfixes

Accidental factory reset fix

Pressing a node's reset button for more than 5 seconds would completely reset a node's configuration under certain conditions.

WAN IPv6 issues

The WAN port would stop to respond to IPv6 packets sometimes, also breaking IPv6 VPN connectivity.

WDR4900 WAN MAC address

The MAC address on the WAN port of the WDR4900 was broken, making this device unusable for *mesh-on-wan* configurations.

4.2.4 Site changes

- `site.conf`
  - `hostname_prefix` is now optional, and is concatenated directly with the generated node ID, in particular no hyphen is inserted anymore. If you want to keep the old behaviour, you have to append the hyphen to the `hostname_prefix` field of your `site.conf`.
  - `mesh_vpn_fastd`: The default peer group name `backbone` isn't hardcoded anymore, any group name can be used. Instead, the `fastd_mesh_vpn` table must now contain an element `groups`, for example:

```
fastd_mesh_vpn = {
    methods = {'salsa2012+umac'},
    mtu = 1426,
    groups = {
        backbone = {
            limit = 2,
            peers = {
                -- ...
            }
        }
    }
}
```

  - `config_mode`: The config mode messages aren't configured in `site.conf` anymore. Instead, they are defined language-specific gettext files in the `i18n` subdirectory of the site configuration (see *Config mode texts*).
  - `roles`: The display strings for the node roles aren't configured in the `site.conf` anymore, but in the site i18n files. The `site.conf` section becomes:

```
roles = {
    default = 'foo',
    list = {
        'foo',
        'bar',
    }
}
```

    The display string use i18n message IDs like `gluon-luci-node-role:role:foo` and `gluon-luci-node-role:role:bar`.

- `site.mk`
  - `gluon-mesh-batman-adv-15` is now the recommended batman-adv version for new Gluon deployments.
  - The packages `gluon-setup-mode` and `gluon-config-mode-core` must now be added to `GLUON_SITE_PACKAGES` explicitly (to allow replacing them with community-specific implementations).
  - The new `GLUON_LANGS` variable selects the config mode languages to include. It defaults to `en`, setting it to `en de` will select both the English and German locales. `en` must always be included.

4.2.5 Internals

New upgrade script directory

The distinction between *initial* and *invariant* scripts has been removed, all scripts are now run on each upgrade. Instead of having one script directory per package, all upgrade scripts lie in `/lib/gluon/upgrade` now, so it is possible to define the run order across packages.

Merged package repository

The Gluon-specific packages have been moved to the `package` directory of the Gluon main repository. The `packages` repository now only contains packages that will be submitted to the OpenWrt upstream eventually.

4.2.6 Known Issues

Alfred/respondd crashes

https://github.com/freifunk-gluon/gluon/issues/177

Occasional alfred crashes may still occur. As this is caused by a kernel issue, we suspect that respondd, which gluon-announced is based on, is affected in the same way.

Ignored TX power offset on Ubiquiti AirMax devices

https://github.com/freifunk-gluon/gluon/issues/94

The default transmission power setting on many of these devices is too high. It may be necessary to make manual adjustments, for example using the `gluon-luci-wifi-config` package. The values shown by `gluon-luci-wifi-config` generally include the TX power offset (amplifier and antenna gain) where available, but on many devices the offset is inaccurate or unavailable.

4.3 Gluon 2014.4

4.3.1 Added (and removed) hardware support

- Buffalo
  - WZR-HP-AG300H / WZR-600DHP
  - WZR-HP-G450H
- D-Link
  - DIR-615 (E1) support had to be dropped
- TP-LINK
  - CPE210/220/510/520 (v1)
  - TL-MR3040 (v2
  - TL-WA750RE (v1)
  - TL-WA801N/ND (v2)
  - TL-WA850RE (v1)
  - TL-WR703N (v1)
  - TL-WR710N (v1)
  - TL-WR1043N/ND (v2)

4.3.2 New features

OpenWrt Barrier Breaker

Switching to the new OpenWrt release 14.09 (“Barrier Breaker”) has yielded lots of updates for both the kernel and most packages. Besides better performance, this has also greatly improved stability (far less out-of-memory issues!).

Modular config mode

The old `gluon-config-mode` package has been split into five small packages, each providing a single section of the config mode form. This simplifies removing or replacing parts of the wizard.

See the *Site changes* section for details.

Experimental support for batman-adv compat 15

As batman-adv has broken compatiblity starting with batman-adv 2014.0 (bumping the "compat level" to 15), Gluon users must decide which batman-adv version to use. The package for the old batman-adv version `gluon-mesh-batman-adv` has been renamed to `gluon-mesh-batman-adv-14`, the new version can be used with `gluon-mesh-batman-adv-15`.

Please note that batman-adv compat 15 still isn't tested very well (and there are known bugs in the current release 2014.3), so for now we still recommend using compat 14 in "production" environments.

fastd v16

Besides other new features and bugfixes, fastd v16 support the new authentication method "UMAC". We recommend switching from the old `salsa2012+gmac` and `null+salsa2012+gmac` methods to the new `salsa2012+umac` and `null+salsa2012+umac` as UMAC is much faster and even more secure than GMAC.

Private WLAN

The new package `gluon-luci-private-wifi` allows to configure a private WLAN with WPA-PSK in the expert mode which is bridged with the WAN uplink.

Embedding SSH keys

Using `gluon-authorized-keys` it is possible to embed predefined SSH public keys to firmware images. If `gluon-config-mode-*` is left out images will be ready to mesh after the first boot with SSH running for further configuration.

Status page resolves nodenames

The tools `gluon-announced` and `gluon-neighbour-info` are now available. Using them enables the status page to resolve hostnames and IPs of a nodes' neighbours.

This will also work on devices with multiple wireless interfaces.

4.3.3 Bugfixes

- Expert Mode: Fixed all SSH keys being removed when a password was set
- `gluon-mesh-vpn-fastd`: Fixed VPN peers removed from the `site.conf` not being removed from `/etc/config/fastd`
- TL-LINK TL-WDR3600/4300: Added workaround for reboot issues
- Improved stability (due to switch to OpenWrt Barrier Breaker)

4.3.4 Site changes

- `site.mk`
  - Obsolete packages:
    * `gluon-config-mode`
    * `gluon-mesh-batman-adv`
  - Recommended new packages:
    * `gluon-config-mode-autoupdater`
    * `gluon-config-mode-hostname`
    * `gluon-config-mode-mesh-vpn`
    * `gluon-config-mode-geo-location`
    * `gluon-config-mode-contact-info`
    * `gluon-mesh-batman-adv-14` (specify this before all other packages in the `site.mk`!)

4.3.5 Internals

The switch to Barrier Breaker has led to a multitude of changes all over Gluon:

- The config mode/setup mode is now started by an own set of init scripts in `/lib/gluon/setup-mode/rc.d` run by procd
- Many tools and services used by Gluon have been replaced by our own implementations to reduce the size of the images:
  - ethtool has been replaced by our minimal Lua library *lua-ethtool-stats*
  - tc has been replaced by our minimal implementation *gluon-simple-tc*
  - radvd has been replaced by our minimal implementation *gluon-radvd*

4.3.6 Known Issues

Alfred crashes

https://github.com/freifunk-gluon/gluon/issues/177

Alfred may still crash unconditionally. Some measures have been taken to aid but the core problem hasn't been analyzed yet.

Out of memory / batman-adv memory leaks

https://github.com/freifunk-gluon/gluon/issues/216

In some (hopefully rare!) cases batman-adv may still leak memory associated with global TT entries. This may result in kernel panics or out-of-memory conditions.

Ignored tx-power offset on Ubiquiti AirMax devices

https://github.com/freifunk-gluon/gluon/issues/94

There is still no OpenWRT support for determining the transmission power offsets on Ubiquiti AirMax devices (Bullet M2, Picostation M2, Nanostation (loco) M2, ...). Use Gluon with caution on these devices! Manual adjustment may be required.

4.4 Gluon 2014.3.1

This is a bugfix release.

4.4.1 Bugfixes

- gluon-announced zombie process bug

  gluon-announced was creating zombie processes when answering requests, causing issues with the new status page which is currently in development.

- fastd peers removed from `site.conf` weren't removed correctly from the fastd configuration on firmware upgrades
- Expert Mode: setting a password will not remove SSH keys anymore
- alfred has been updated to 2014.3.0

  We hope this solves the alfred stability issues noted by several people.

- `gluon-ebtables-filter-ra-dhcp` and `gluon-ebtables-filter-multicast` have been fixed to allow DHCPv6 to work
- Another ath9k patch has been added, which might further improve WLAN stability and performance

4.4.2 New features

- Support for static WAN setups instead of (DHCP/Router Advertisement) has been added; configuration is possible on the port config page of the Expert Mode.

4.4.3 Site changes

- `site.conf`
  - The new boolean option `fastd_mesh_vpn.enabled` allows enabling the mesh VPN by default. This value is optional; if it isn't specified, the mesh VPN will be disabled.

4.5 Gluon 2014.3

4.5.1 New hardware support

- Linksys WRT160NL

4.5.2 New features

New autoupdater

The autoupdater has been rewritten.

Two new fields have been added to the manifest:

DATE Specifies the time and date the update was released. `make manifest` will take care of setting it to the correct value.

PRIORITY Specifies the maximum number of days until the update should be attempted (thus lower numbers mean the priority is higher). It must be set either in `site.mk` or on the `make manifest` command line.

Updates will be attempted at night, between 04:00 and 5:00, with a specific probability. When less than `PRIORITY` days have passed (calculated using `DATE` and the current time), the probability will proportional to the time passed. I.e. the update probability will start at 0 and slowly increase to 1 until `PRIORITY` days have passed. From then, the probability will be fixed at 1.

Note: For the new update logic to work, a valid NTP server reachable over the mesh (using IPv6) must be configured in `site.conf`. If the autoupdater is unable to determine the correct time, it will fall back to a behavior similar to the old implementation (i.e. hourly update attempts).

Seperation of announced data

The data announced by alfred has been split into two data types:

- *nodeinfo* (type 158) contains all static information about a node
- *statistics* (type 159) contains all dynamic information about a node

Both types also contain a new field `node_id` which contains an arbitrary unique ID (currently the primary MAC address, sans colons) which can be used to match the *nodeinfo* with *statistics* information.

gluon-announced

A new daemon has been added in a new package `gluon-announced`. This daemon can be used for querying the *nodeinfo* data of a node via link-local multicast on the ad-hoc interfaces.

At the moment, this daemon is not used, but we recommend including it in `site.mk` nevertheless as we plan to implement a new status page showing some information about neighbor nodes in the next version of Gluon.

VPN over IPv6

It is now possible to use fastd in IPv6 WAN networks. This still needs testing, but it should work well.

Please note that the MTU of 1426 used by many communities for VPN over IPv4 is too big for IPv6 as the IPv6 header is 20 bytes longer (fastd over IPv4 has an overhead of 66 bytes, fastd over IPv6 has an overhead of 86 bytes).

More modular Config Mode

The package `gluon-config-mode` has been split into multiple packages to simplify the development of extensions. The low-level logic (handling of the button, starting the services for the config mode) has been moved into a new package `gluon-setup-mode`, while `gluon-config-mode` only contains the frontend now.

Extended Expert Mode

The Expert Mode now has a nice info page. In addition, the new package `gluon-luci-portconfig` has been added which allows simple configuration of batman-adv on the WAN interface.

Site validators

The content of the `site.conf` is now validated when the images are built to make it less likely to accidentially build broken images.

gluon-firewall

The package `gluon-firewall` has been removed. Its features are now part of the packages `gluon-core` and `gluon-mesh-batman-adv`.

gluon-ath9k-workaround

This package installs a cron job which tries to recognize ath9k hangs and restart the WLAN while recording some information. It is very rudimentary and we can't really recommend using it on "production" nodes.

4.5.3 Bugfixes

Improved ath9k stability

Multiple bugs in the WLAN driver ath9k have been fixed upstream. This should greatly improve the WLAN stability.

odhcp6c 50 day bug

An important update for odhcp6c fixes a bug which caused Gluon nodes to lose their IPv6 addresses on br-client after an uptime of 50 days, making the nodes unable perform automated updates (besides other issues).

IPv6 preference

Commands like `wget` now prefer IPv6 for domains with both AAAA and A records, allowing to use such domains for the autoupdater URLs and as NTP servers in `site.conf`.

4.5.4 Site changes

- `site.conf`
  - The `probability` fields for the autoupdater branches can be dropped as they aren't used anymore
  - The type of the `enabled` options of the `gluon-simple-tc` configuration has been changed to boolean, so `true` and `false` must be used instead of 1 and 0 now
- `site.mk`
  - Obsolete packages:
    * `gluon-firewall`
  - Recommended new packages:

    * gluon-announced

    * gluon-luci-portconfig

  - GLUON_PRIORITY must be set in `site.mk` or on the `make manifest` commandline. Use `GLUON_PRIORITY ?= 0` in `site.mk` to allow overriding from the commandline.

4.5.5 Internals

Some internal changes not mentioned before which are interesting for developers:

- Many more shell scripts have been converted to Lua
- `gluon-mesh-vpn-fastd` now uses the new package `gluon-wan-dnsmasq`, which provides a secondary DNS server on port 54 that is only reachable from *localhost* and uses the DNS servers on the WAN interface for everything. This allowed us to remove some ugly hacks which were making the DNS servers used depend on the domain being resolved.

  For IPv6, the default route is now controlled via packet marks, so the secondary DNS server and fastd set the packet mark so they use the default route provided on the WAN interface instead of the mesh.
