CHAPTER 1

cprob module

Probability integrals and their inverses.

Beta distribution

Cumulative distribution function

btdtr (a, b, x)

Returns the area from zero to x under the beta density function.

Parameters

- **a** (*float*) – a positive number
- **b** (*float*) – a positive number
- **x** (*float*) – any number within [0, 1]

See also *incbet()*.

Description

Returns the area from zero to x under the beta density function:

$$P(x \mid a, b) = \frac{\Gamma(a+b)}{\Gamma(a)+\Gamma(b)} \int_0^x t^{a-1}(1-t)^{b-1}dt$$

This function is identical to the incomplete beta integral function *incbet()*.

The complemented function is:

1 - P(1-x | a, b) = incbet(b, a, x)

Accuracy

See *incbet()*.

Reference: http://www.netlib.org/cephes/doubldoc.html#btdtr

Incomplete beta function

incbet(*a*, *b*, *x*)

Returns incomplete beta integral of the arguments, evaluated from zero to x. The function is defined as

Parameters

- **a** (*float*) – a positive number
- **b** (*float*) – a positive number
- **x** (*float*) – any number within [0, 1]

See also *incbi()*.

Description

$$\frac{\Gamma(a+b)}{\Gamma(a)+\Gamma(b)} \int_0^x t^{a-1}(1-t)^{b-1}dt$$

The domain of definition is 0 <= x <= 1. In this implementation a and b are restricted to positive values. The integral from x to 1 may be obtained by the symmetry relation:

```
1 - incbet(a, b, x)  =  incbet(b, a, 1 - x)
```

The integral is evaluated by a continued fraction expansion or, when b*x is small, by a power series.

Accuracy

Tested at uniformly distributed random points (a, b, x) with a and b in "domain" and x between 0 and 1.

			Relative error	
arithmetic	domain	# trials	peak	rms
IEEE	0,5	10000	6.9e-15	4.5e-16
IEEE	0,85	250000	2.2e-13	1.7e-14
IEEE	0,1000	30000	5.3e-12	6.3e-13
IEEE	0,10000	250000	9.3e-11	7.1e-12
IEEE	0,100000	10000	8.7e-10	4.8e-11

Outputs smaller than the IEEE gradual underflow threshold were excluded from these statistics.

Error messages

message	condition	value returned
incbet domain	x < 0, x > 1	0.0
incbet underflow		0.0

Reference: http://www.netlib.org/cephes/doubldoc.html#incbet

Inverse of incomplete beta function

incbi(*a*, *b*, *y*)

Given y, the function finds x such that *incbet(a, b, y)* = *x*.

Parameters

- **a** (*float*) – a positive number
- **b** (*float*) – a positive number
- **x** (*float*) – any number within [0, 1]

See also *incbet()*.

Description

The routine performs interval halving or Newton iterations to find the root of *incbet(a,b,x) - y = 0*.

Accuracy

				relative error	
	x	a, b			
arithmetic	domain	domain	# trials	peak	rms
IEEE	0, 1	.5, 10000	50000	5.8e-12	1.3e-13
IEEE	0, 1	.25, 100	100000	1.8e-13	3.9e-15
IEEE	0, 1	0, 5	50000	1.1e-12	5.5e-15
VAX	0, 1	.5, 100	25000	3.5e-14	1.1e-15
With a and b constrained to half-integer or integer values					
IEEE	0, 1	.5, 10000	50000	5.8e-12	1.1e-13
IEEE	0, 1	.5, 100	100000	1.7e-14	7.9e-16
With a=.5, b constrained to half-integer or integer values					
IEEE	0, 1	.5, 10000	10000	8.3e-11	1.0e-11

Reference: http://www.netlib.org/cephes/doubldoc.html#incbi

Binomial distribution

Cumulative distribution function

bdtr (*k*, *n*, *p*)

Returns the sum of the terms 0 through k of the Binomial probability density. The function is defined as:

Parameters

- **k** (*int*) – number of successes within [0, n]
- **n** (*int*) – number of trials
- **p** (*float*) – probability of success within [0, 1]

See also *bdtrc()* and *bdtri()*.

Description

$$\sum_{j=0}^{k} \binom{n}{j} p^j (1-p)^{n-j}$$

The terms are not summed directly; instead the incomplete beta integral is employed, according to the formula:

```
y = bdtr(k, n, p) = incbet(n - k, k +1, 1 - p)
```

The arguments must be positive, with p ranging from 0 to 1.

Accuracy

Tested at random points (a, b, p), with p between 0 and 1.

	a, b		relative error	
arithmetic	domain	# trials	peak	rms
For p between 0.001 and 1				
IEEE	0, 100	100000	4.3e-15	2.6e-16

See also *incbi()*.

Error messages

message	condition	value returned
bdtr domain	k < 0	0.0
	n < k	
	x < 0, x > 1	

Reference: http://www.netlib.org/cephes/doubldoc.html#bdtr

Survival function

bdtrc(*k*, *n*, *p*)

Returns the sum of the terms k + 1 through n of the Binomial probability density:

Parameters

- **k** (*int*) – number of successes within [0, n]
- **n** (*int*) – number of trials
- **p** (*float*) – probability of success within [0, 1]

See also *bdtr()* and *bdtri()*.

Description

$$\sum_{j=k+1}^{n} \binom{n}{j} p^j (1-p)^{n-j}$$

The terms are not summed directly; instead the incomplete beta integral is employed, according to the formula:

```
y = bdtrc( k, n, p ) = incbet( k+1, n-k, p )
```

The arguments must be positive, with p ranging from 0 to 1.

Accuracy

Tested at random points (a, b, p).

	a, b		relative error	
arithmetic	domain	# trials	peak	rms
For p between 0.001 and 1				
IEEE	0, 100	100000	6.7e-15	8.2e-16
For p between 0 and .001				
IEEE	0, 100	100000	1.5e-13	2.7e-15

Error messages

message	condition	value returned
bdtrc domain	x < 0, x > 1, n < k	0.0

Reference: http://www.netlib.org/cephes/doubldoc.html#bdtrc

Inverse of the cumulative distribution function

bdtri (*k*, *n*, *y*)

Finds the event probability p such that the sum of the terms 0 through k of the Binomial probability density is equal to the given cumulative probability y.

Parameters

- **k** (*int*) – number of successes within [0, n]
- **n** (*int*) – number of trials
- **y** (*float*) – cumulative probability within [0, 1]

See also *bdtr()* and *bdtrc()*.

Description

This is accomplished using the inverse beta integral function and the relation:

```
1 - p = incbi(n - k, k + 1, y)
```

Accuracy

Tested at random points (a, b, p).

	a, b		relative error	
arithmetic	domain	# trials	peak	rms
For p between 0.001 and 1				
IEEE	0, 100	100000	2.3e-14	6.4e-16
IEEE	0, 10000	100000	6.6e-12	1.2e-13
For p between 10^-6 and 0.001				
IEEE	0, 100	100000	2.0e-12	1.3e-14
IEEE	0, 10000	100000	1.5e-12	3.2e-14

See also *incbi()*.

Error messages

message	condition	value returned
bdtri domain	k < 0, n <= k	0.0
	x < 0, x > 1	

Reference: http://www.netlib.org/cephes/doubldoc.html#bdtri

Chi-square distribution

Cumulative distribution function

chdtr(k, x)

Returns the area under the left hand tail (from 0 to x) of the Chi square probability density function with k degrees of freedom.

Parameters

- **k** (*int*) – degrees of freedom
- **x** (*float*) – positive Chi square variable

Description

$$P(x \mid k) = \frac{1}{\Gamma(k/2)} \int_0^{x/2} t^{k/2-1} e^{-t} dt$$

The incomplete gamma integral is used according to the formula:

```
chdtr(k, x) = igam(k/2, x/2)
```

The arguments must both be positive.

Accuracy

See `igam()` for accuracy.

Error messages

message	condition	value returned
chdtr domain	x < 0 or v < 1	0

Reference: http://www.netlib.org/cephes/doubldoc.html#chdtr

Survival function

chdtrc(k, x)

Returns the area under the right hand tail (from x to infinity) of the Chi square probability density function with k degrees of freedom.

Parameters

- **k** (*int*) – degrees of freedom

- **x** (*float*) – positive Chi square variable

Description

The incomplete gamma integral is used according to the formula:

```
chdtr(k, x) = igamc(k/2, x/2)
```

The arguments must both be positive.

Accuracy

See `igamc()` for accuracy.

Error messages

message	condition	value returned
chdtrc domain	x < 0 or v < 1	0

Reference: http://www.netlib.org/cephes/doubldoc.html#chdtrc

Inverse of the survival function

chdtri(*k*, *y*)

Finds the Chi-square argument x such that the integral from x to infinity of the Chi-square density is equal to the given cumulative probability y.

Parameters

- **k** (*int*) – degrees of freedom
- **y** (*float*) – cumulative probability

Description

This is accomplished using the inverse gamma integral function and the relation:

```
x/2 = igami(k/2, y)
```

Accuracy

See `igami()` for accuracy.

Error messages

message	condition	value returned
chdtri domain	y < 0 or y > 1	0
	k < 1	

Reference: http://www.netlib.org/cephes/doubldoc.html#chdtri

F distribution

Cumulative distribution function

fdtr (*df1*, *df2*, *x*)

Returns the area from zero to x under the F density function (also known as Snedcor's density or the variance ratio density).

Parameters

- **df1** (*int*) – degrees of freedom
- **df2** (*int*) – degrees of freedom
- **x** (*float*) – positive F variable

Description

This is the density of x = (u1/df1)/(u2/df2), where u1 and u2 are random variables having Chi square distributions with df1 and df2 degrees of freedom, respectively.

The incomplete beta integral is used according to the formula:

```
P(x) = incbet(df1/2, df2/2, (df1 * x/(df2 + df1*x))
```

The arguments a and b are greater than zero, and x is nonnegative.

Accuracy

Tested at random points (a, b, x).

	x	a, b		relative error	
arithmetic	domain	domain	# trials	peak	rms
IEEE	0, 1	0, 100	100000	9.8e-15	1.7e-15
IEEE	1, 5	0, 100	100000	6.5e-15	3.5e-16
IEEE	0, 1	1, 10000	100000	2.2e-11	3.3e-12
IEEE	1, 5	1, 10000	100000	1.1e-11	1.7e-13

See also *incbet()*.

Error messages

message	condition	value returned
fdtr domain	a<0, b<0, x<0	0

Reference: http://www.netlib.org/cephes/doubldoc.html#fdtr

Survival function

Inverse of the cumulative distribution function

Normal distribution

Complementary error function

erfc (x)

Computes `1 -erf(x)` in a numerically stable way.

Parameters **x** (*float*) – a real scalar.

Description

$$1 - \operatorname{erf}(x) = \operatorname{erfc}(x) = \frac{2}{\sqrt{\pi}} \int_x^\infty \exp\left(-t^2\right) dt$$

For small x, `erfc(x) = 1 -erf(x)`; otherwise rational approximations are computed.

A special function `expx2()` is used to suppress error amplification in computing $\exp\left(-x^2\right)$.

Accuracy

			Relative error	
arithmetic	domain	# trials	peak	rms
IEEE	0, 26.6417	30000	1.3e-15	2.2e-16

Error messages

message	condition	value returned
erfc underflow	x > 9.231948545 (DEC)	0.0

Reference: http://www.netlib.org/cephes/doubldoc.html#erfc

Cumulative distribution function

ndtr (x)

Returns the area under the Gaussian probability density function, integrated from minus infinity to `x`.

Parameters **x** (*float*) – a real scalar.

Description

Area under the curve:

$$\frac{1}{\sqrt{2\pi}} \int_{-\infty}^{x} \exp(-t^2/2) dt$$

Equivalently, we have:

```
ndtr(x) = ( 1 + erf(z) ) / 2 =  erfc(z) / 2
```

where $z = x/\sqrt{2}$. Computation is done via the functions *erf()* and *erfc()* with care to avoid error amplification in computing $\exp(-x^2)$.

Accuracy

	x		relative error	
arithmetic	domain	# trials	peak	rms
IEEE	-13, 0	30000	1.3e-15	2.2e-16

Error messages

message	condition	value returned
erfc underflow	x > 37.519379347	0.0

Reference: http://www.netlib.org/cephes/doubldoc.html#ndtr

Error function

erf (x)

Parameters **x** (*float*) – a real scalar.

Description

The integral is

$$\mathrm{erf}(x) = \frac{2}{\sqrt{\pi}} \int_0^x \exp(-t^2) dt.$$

The magnitude of x is limited to 9.231948545 for DEC arithmetic; 1 or -1 is returned outside this range.

For $0 <= |x| < 1$, $\mathrm{erf}(x) = x * P4(x**2)/Q5(x**2)$; otherwise $\mathrm{erf}(x) = 1 - \mathrm{erfc}(x)$.

Accuracy

			Relative error	
arithmetic	domain	# trials	peak	rms
DEC	0, 1	14000	4.7e-17	1.5e-17
IEEE	0, 1	30000	3.7e-16	1.0e-16

Reference: http://www.netlib.org/cephes/doubldoc.html#erf

Inverse of the cumulative distribution function

ndtri (y)

Returns the argument x for which the area under the Gaussian probability density function (integrated from minus infinity to x) is equal to y.

Parameters **y** (*float*) – area under the curve.

Description

For small arguments $0 < y < \exp(-2)$, the program computes $z = \sqrt{-2.0 * \log y}$; then the approximation is

$$x = z - \log(z)/z - (1/z)P(1/z)/Q(1/z).$$

There are two rational functions P/Q, one for $0 < y < \exp(-32)$ and the other for y up to $\exp(-2)$. For larger arguments, $w = y - 0.5$, and

$$x/\sqrt{2\pi} = w + w^3 R(w^2)/S(w^2).$$

Accuracy

			Relative error	
arithmetic	domain	# trials	peak	rms
DEC	0.125, 1	5500	9.5e-17	2.1e-17
DEC	6e-39, 0.135	3500	5.7e-17	1.3e-17
IEEE	0.125, 1	20000	7.2e-16	1.3e-16
IEEE	3e-308, 0.135	50000	4.6e-16	9.8e-17

Error messages

message	condition	value returned
ndtri domain	x <= 0	-MAXNUM
ndtri domain	x >= 1	MAXNUM
