pygbif Documentation

Release 0.1.2

Scott Chamberlain

Jun 21, 2017

Contents

Python client for the GBIF API.

Source on GitHub at sckott/pygbif

pygbif is split up into modules for each of the major groups of API methods.

- Registry - Datasets, Nodes, Installations, Networks, Organizations - Registry API Docs

- Species - Taxonomic names - Species API Docs

- Occurrences - Occurrence data, including the download API - Occurrences API Docs

Note that GBIF maps API is not included in *pygbif*.

Other GBIF clients:

- R: rgbif

Installation

```
pip install pygbif
```

Registry module

```
from pygbif import registry
registry.dataset_metrics(uuid='3f8a1297-3259-4700-91fc-acc4170b27ce')
```

Species module

```python
from pygbif import species
species.name_suggest(q='Puma concolor')
```

Occurrences module

```python
from pygbif import occurrences
occurrences.search(taxonKey = 3329049)
occurrences.get(taxonKey = 252408386)
occurrences.count(isGeoreferenced = True)
```

Meta

- License: MIT, see LICENSE file

- Please note that this project is released with a Contributor Code of Conduct. By participating in this project you agree to abide by its terms.

occurrences module

occurrences.**search**(*taxonKey=None,* *scientificName=None,* *country=None,* *publishingCountry=None,* *hasCoordinate=None,* *typeStatus=None,* *recordNumber=None,* *lastInterpreted=None, continent=None, geometry=None, recordedBy=None, basisOfRecord=None, datasetKey=None, eventDate=None, catalogNumber=None, year=None, month=None, decimalLatitude=None, decimalLongitude=None, elevation=None, depth=None, institutionCode=None, collectionCode=None, hasGeospatialIssue=None, issue=None, q=None, mediatype=None, limit=500, offset=0, **kwargs*)

Search GBIF occurrences

> **Parameters**
>
> - **taxonKey** – [Fixnum] A GBIF occurrence identifier
>
> - **scientificName** – A scientific name from the GBIF backbone. All included and synonym taxa are included in the search.
>
> - **datasetKey** – The occurrence dataset key (a uuid)
>
> - **catalogNumber** – An identifier of any form assigned by the source within a physical collection or digital dataset for the record which may not unique, but should be fairly unique in combination with the institution and collection code.
>
> - **recordedBy** – The person who recorded the occurrence.

- **collectionCode** – An identifier of any form assigned by the source to identify the physical collection or digital dataset uniquely within the text of an institution.

- **institutionCode** – An identifier of any form assigned by the source to identify the institution the record belongs to. Not guaranteed to be que.

- **country** – The 2-letter country code (as per ISO-3166-1) of the country in which the occurrence was recorded. See here http://en.wikipedia.org/wiki/ISO_3166-1_alpha-2}

- **basisOfRecord** – Basis of record, as defined in our BasisOfRecord enum here http://gbif.github.io/gbif-api/apidocs/org/gbif/api/vocabulary/BasisOfRecord.html Acceptable values are:

  - FOSSIL_SPECIMEN An occurrence record describing a fossilized specimen.

  - HUMAN_OBSERVATION An occurrence record describing an observation made by one or more people.

  - LITERATURE An occurrence record based on literature alone.

  - LIVING_SPECIMEN An occurrence record describing a living specimen, e.g.

  - MACHINE_OBSERVATION An occurrence record describing an observation made by a machine.

  - OBSERVATION An occurrence record describing an observation.

  - PRESERVED_SPECIMEN An occurrence record describing a preserved specimen.

  - UNKNOWN Unknown basis for the record.

- **eventDate** – Occurrence date in ISO 8601 format: yyyy, yyyy-MM, yyyy-MM-dd, or MM-dd. Supports range queries, smaller,larger (e.g., '1990,1991', whereas '1991,1990' wouldn't work)

- **year** – The 4 digit year. A year of 98 will be interpreted as AD 98. Supports range queries, smaller,larger (e.g., '1990,1991', whereas '1991,1990' wouldn't work)

- **month** – The month of the year, starting with 1 for January. Supports range queries, smaller,larger (e.g., '1,2', whereas '2,1' wouldn't work)

- **q** – Query terms. The value for this parameter can be a simple word or a phrase.

- **decimalLatitude** – Latitude in decimals between -90 and 90 based on WGS 84. Supports range queries, smaller,larger (e.g., '25,30', whereas '30,25' wouldn't work)

- **decimalLongitude** – Longitude in decimals between -180 and 180 based on WGS 84. Supports range queries (e.g., '-0.4,-0.2', whereas '-0.2,-0.4' wouldn't work).

- **publishingCountry** – The 2-letter country code (as per ISO-3166-1) of the country in which the occurrence was recorded.

- **elevation** – Elevation in meters above sea level. Supports range queries, smaller,larger (e.g., '5,30', whereas '30,5' wouldn't work)

- **depth** – Depth in meters relative to elevation. For example 10 meters below a lake surface with given elevation. Supports range queries, smaller,larger (e.g., '5,30', whereas '30,5' wouldn't work)

- **geometry** – Searches for occurrences inside a polygon described in Well Known Text (WKT) format. A WKT shape written as either POINT, LINESTRING, LINEARRING or POLYGON. Example of a polygon: ((30.1 10.1, 20, 20 40, 40 40, 30.1 10.1)) would be queried as http://bit.ly/1BzNwDq}.

- **hasGeospatialIssue** – (logical) Includes/excludes occurrence records which contain spatial issues (as determined in our record interpretation), i.e. code{hasGeospatialIssue=TRUE} returns only those records with spatial issues while code{hasGeospatialIssue=FALSE} includes only records without spatial issues. The absence of this parameter returns any record with or without spatial issues.

- **issue** – (character) One or more of many possible issues with each occurrence record. See Details. Issues passed to this parameter filter results by the issue.

- **hasCoordinate** – (logical) Return only occurence records with lat/long data (TRUE) or all records (FALSE, default).

- **typeStatus** – Type status of the specimen. One of many options. See ?typestatus

- **recordNumber** – Number recorded by collector of the data, different from GBIF record number. See http://rs.tdwg.org/dwc/terms/#recordNumber} for more info

- **lastInterpreted** – Date the record was last modified in GBIF, in ISO 8601 format: yyyy, yyyy-MM, yyyy-MM-dd, or MM-dd. Supports range queries, smaller,larger (e.g., '1990,1991', whereas '1991,1990' wouldn't work)

- **continent** – Continent. One of africa, antarctica, asia, europe, north_america (North America includes the Caribbean and reachies down and includes Panama), oceania, or south_america

- **fields** – (character) Default ('all') returns all fields. 'minimal' returns just taxon name, key, latitude, and longitute. Or specify each field you want returned by name, e.g. fields = c('name','latitude','elevation').

- **return** – One of data, hier, meta, or all. If data, a data.frame with the data. hier returns the classifications in a list for each record. meta returns the metadata for the entire call. all gives all data back in a list.

- **mediatype** – Media type. Default is NULL, so no filtering on mediatype. Options: NULL, 'MovingImage', 'Sound', and 'StillImage'.''

- **limit** – [Fixnum] Number of results to return.

- **offset** – [Fixnum] Start at record X

Returns A dictionary, of results

Usage:

```python
from pygbif import occurrences
occurrences.search(taxonKey = 3329049)

# Return 2 results, this is the default by the way
occurrences.search(taxonKey=3329049, limit=2)

# Instead of getting a taxon key first, you can search for a name directly
## However, note that using this approach (with \code{scientificName="..."})
## you are getting synonyms too. The results for using \code{scientifcName} and
## \code{taxonKey} parameters are the same in this case, but I wouldn't be
→surprised if for some
## names they return different results
occurrences.search(scientificName = 'Ursus americanus')
from pygbif import species
key = species.name_backbone(name = 'Ursus americanus', rank='species')['usageKey']
occurrences.search(taxonKey = key)

# Search by dataset key
```

```python
occurrences.search(datasetKey='7b5d6a48-f762-11e1-a439-00145eb45e9a', limit=20)

# Search by catalog number
occurrences.search(catalogNumber="49366", limit=20)
# occurrences.search(catalogNumber=["49366","Bird.27847588"], limit=20)

# Use paging parameters (limit and start) to page. Note the different results
# for the two queries below.
occurrences.search(datasetKey='7b5d6a48-f762-11e1-a439-00145eb45e9a', offset=10,
→limit=5)
occurrences.search(datasetKey='7b5d6a48-f762-11e1-a439-00145eb45e9a', offset=20,
→limit=5)

# Many dataset keys
# occurrences.search(datasetKey=["50c9509d-22c7-4a22-a47d-8c48425ef4a7",
→"7b5d6a48-f762-11e1-a439-00145eb45e9a"], limit=20)

# Search by collector name
res = occurrences.search(recordedBy="smith", limit=20)
[ x['recordedBy'] for x in res['results'] ]

# Many collector names
# occurrences.search(recordedBy=["smith","BJ Stacey"], limit=20)

# Search for many species
splist = ['Cyanocitta stelleri', 'Junco hyemalis', 'Aix sponsa']
keys = [ species.name_suggest(x)[0]['key'] for x in splist ]
out = [ occurrences.search(taxonKey = x, limit=1) for x in keys ]
[ x['results'][0]['speciesKey'] for x in out ]

# Search - q parameter
occurrences.search(q="kingfisher", limit=2)

# Search on latitidue and longitude
occurrences.search(decimalLatitude=50, decimalLongitude=10, limit=2)

# Search on a bounding box
## in well known text format
occurrences.search(geometry='POLYGON((30.1 10.1, 10 20, 20 40, 40 40, 30.1 10.1))
→', limit=20)
from pygbif import species
key = species.name_suggest(q='Aesculus hippocastanum')[0]['key']
occurrences.search(taxonKey=key, geometry='POLYGON((30.1 10.1, 10 20, 20 40, 40
→40, 30.1 10.1))', limit=20)

# Search on country
occurrences.search(country='US', limit=20)
occurrences.search(country='FR', limit=20)
occurrences.search(country='DE', limit=20)

# Get only occurrences with lat/long data
occurrences.search(taxonKey=key, hasCoordinate=True, limit=20)

# Get only occurrences that were recorded as living specimens
occurrences.search(taxonKey=key, basisOfRecord="LIVING_SPECIMEN",
→hasCoordinate=True, limit=20)

# Get occurrences for a particular eventDate
```

```
occurrences.search(taxonKey=key, eventDate="2013", limit=20)
occurrences.search(taxonKey=key, year="2013", limit=20)
occurrences.search(taxonKey=key, month="6", limit=20)

# Get occurrences based on depth
key = species.name_backbone(name='Salmo salar', kingdom='animals')['usageKey']
occurrences.search(taxonKey=key, depth="5", limit=20)

# Get occurrences based on elevation
key = species.name_backbone(name='Puma concolor', kingdom='animals')['usageKey']
occurrences.search(taxonKey=key, elevation=50, hasCoordinate=True, limit=20)

# Get occurrences based on institutionCode
occurrences.search(institutionCode="TLMF", limit=20)

# Get occurrences based on collectionCode
occurrences.search(collectionCode="Floristic Databases MV - Higher Plants",
↪limit=20)

# Get only those occurrences with spatial issues
occurrences.search(taxonKey=key, hasGeospatialIssue=True, limit=20)

# Search using a query string
occurrences.search(q="kingfisher", limit=20)

# Range queries
## See Detail for parameters that support range queries
### this is a range depth, with lower/upper limits in character string
occurrences.search(depth='50,100')

## Range search with year
occurrences.search(year='1999,2000', limit=20)

## Range search with latitude
occurrences.search(decimalLatitude='29.59,29.6')

# Search by specimen type status
## Look for possible values of the typeStatus parameter looking at the typestatus
↪dataset
occurrences.search(typeStatus = 'allotype')

# Search by specimen record number
## This is the record number of the person/group that submitted the data, not GBIF
↪'s numbers
## You can see that many different groups have record number 1, so not super
↪helpful
occurrences.search(recordNumber = 1)

# Search by last time interpreted: Date the record was last modified in GBIF
## The lastInterpreted parameter accepts ISO 8601 format dates, including
## yyyy, yyyy-MM, yyyy-MM-dd, or MM-dd. Range queries are accepted for
↪lastInterpreted
occurrences.search(lastInterpreted = '2014-04-01')

# Search by continent
## One of africa, antarctica, asia, europe, north_america, oceania, or south_
↪america
occurrences.search(continent = 'south_america')
```

```python
occurrences.search(continent = 'africa')
occurrences.search(continent = 'oceania')
occurrences.search(continent = 'antarctica')

# Search for occurrences with images
occurrences.search(mediatype = 'StillImage')
occurrences.search(mediatype = 'MovingImage')
x = occurrences.search(mediatype = 'Sound')
[z['media'] for z in x['results']]

# Query based on issues
occurrences.search(taxonKey=1, issue='DEPTH_UNLIKELY')
occurrences.search(taxonKey=1, issue=['DEPTH_UNLIKELY','COORDINATE_ROUNDED'])
# Show all records in the Arizona State Lichen Collection that cant be matched to
↪the GBIF
# backbone properly:
occurrences.search(datasetKey='84c0e1a0-f762-11e1-a439-00145eb45e9a', issue=[
↪'TAXON_MATCH_NONE','TAXON_MATCH_HIGHERRANK'])

# If you pass in an invalid polygon you get hopefully informative errors
### the WKT string is fine, but GBIF says bad polygon
wkt = 'POLYGON((-178.59375 64.83258989321493,-165.9375 59.24622380205539,

```

occurrences.**get** (*key*, ***kwargs*)

    Gets details for a single, interpreted occurrence

        Parameters **key** – [Fixnum] A GBIF occurrence key

        Returns A dictionary, of results

    Usage:

```python
from pygbif import occurrences
occurrences.get(key = 252408386)
```

occurrences.**get_verbatim** (*key*, ***kwargs*)

    Gets a verbatim occurrence record without any interpretation

        Parameters **key** – [Fixnum] A GBIF occurrence key

        Returns A dictionary, of results

Usage:

```
from pygbif import occurrences
occurrences.get_verbatim(key = 252408386)
```

occurrences.**get_fragment**(*key*, ***kwargs*)

Get a single occurrence fragment in its raw form (xml or json)

    Parameters key – [Fixnum] A GBIF occurrence key

    Returns A dictionary, of results

Usage:

```
from pygbif import occurrences
occurrences.get_fragment(key = 1052909293)
```

occurrences.**count**(*taxonKey=None*, *basisOfRecord=None*, *country=None*, *isGeoreferenced=None*, *datasetKey=None*, *publishingCountry=None*, *typeStatus=None*, *issue=None*, *year=None*, ***kwargs*)

Returns occurrence counts for a predefined set of dimensions

    Parameters

- **taxonKey** – [int] A GBIF occurrence identifier
- **basisOfRecord** – [str] A GBIF occurrence identifier
- **country** – [str] A GBIF occurrence identifier
- **isGeoreferenced** – [bool] A GBIF occurrence identifier
- **datasetKey** – [str] A GBIF occurrence identifier
- **publishingCountry** – [str] A GBIF occurrence identifier
- **typeStatus** – [str] A GBIF occurrence identifier
- **issue** – [str] A GBIF occurrence identifier
- **year** – [int] A GBIF occurrence identifier

    Returns dict

Usage:

```
from pygbif import occurrences
occurrences.count(taxonKey = 3329049)
occurrences.count(country = 'CA')
occurrences.count(isGeoreferenced = True)
occurrences.count(basisOfRecord = 'OBSERVATION')
```

occurrences.**count_basisofrecord**(***kwargs*)

Lists occurrence counts by basis of record.

    Returns dict

Usage:

```
from pygbif import occurrences
occurrences.count_basisofrecord()
```

occurrences.**count_year**(*year*, ***kwargs*)

Lists occurrence counts by year

Parameters **year** – [int] year range, e.g., "1990,2000". Does not support ranges like "asterisk,2010"

Returns dict

Usage:

```
from pygbif import occurrences
occurrences.count_year(year = '1990,2000')
```

occurrences.**count_datasets**(*taxonKey=None*, *country=None*, ***kwargs*)

Lists occurrence counts for datasets that cover a given taxon or country

Parameters

- **taxonKey** – [int] Taxon key
- **country** – [str] A country, two letter code

Returns dict

Usage:

```
from pygbif import occurrences
occurrences.count_datasets(country = "DE")
```

occurrences.**count_countries**(*publishingCountry*, ***kwargs*)

Lists occurrence counts for all countries covered by the data published by the given country

Parameters **publishingCountry** – [str] A two letter country code

Returns dict

Usage:

```
from pygbif import occurrences
occurrences.count_countries(publishingCountry = "DE")
```

occurrences.**count_schema**(***kwargs*)

List the supported metrics by the service

Returns dict

Usage:

```
from pygbif import occurrences
occurrences.count_schema()
```

occurrences.**count_publishingcountries**(*country*, ***kwargs*)

Lists occurrence counts for all countries that publish data about the given country

Parameters **country** – [str] A country, two letter code

Returns dict

Usage:

```
from pygbif import occurrences
occurrences.count_publishingcountries(country = "DE")
```

registry module

registry.**datasets**(*data='all'*, *type=None*, *uuid=None*, *query=None*, *id=None*, *limit=100*, *start=None*, ***kwargs*)

Search for datasets and dataset metadata.

Parameters

- **data** – The type of data to get. Default is all data.

- **type** – Type of dataset, options include OCCURRENCE, etc.

- **uuid** – UUID of the data node provider. This must be specified if data is anything other than 'all'.

- **query** – Query term(s). Only used when data='all'

- **id** – A metadata document id.

References http://www.gbif.org/developer/registry#datasets

Usage:

```python
from pygbif import registry
registry.datasets(limit=5)
registry.datasets(type="OCCURRENCE")
registry.datasets(uuid="a6998220-7e3a-485d-9cd6-73076bd85657")
registry.datasets(data='contact', uuid="a6998220-7e3a-485d-9cd6-73076bd85657")
registry.datasets(data='metadata', uuid="a6998220-7e3a-485d-9cd6-73076bd85657")
registry.datasets(data='metadata', uuid="a6998220-7e3a-485d-9cd6-73076bd85657",
→id=598)
registry.datasets(data=['deleted','duplicate'])
registry.datasets(data=['deleted','duplicate'], limit=1)
```

registry.**dataset_metrics**(*uuid*, ***kwargs*)

Get details on a GBIF dataset.

Parameters **uuid** – (character) One or more dataset UUIDs. See examples.

References: http://www.gbif.org/developer/registry#datasetMetrics

Usage:

```python
from pygbif import registry
registry.dataset_metrics(uuid='3f8a1297-3259-4700-91fc-acc4170b27ce')
registry.dataset_metrics(uuid='66dd0960-2d7d-46ee-a491-87b9adcfe7b1')
registry.dataset_metrics(uuid=['3f8a1297-3259-4700-91fc-acc4170b27ce', '66dd0960-
→2d7d-46ee-a491-87b9adcfe7b1'])
```

registry.**installations**(*data='all'*, *uuid=None*, *query=None*, *identifier=None*, *identifierType=None*, *limit=100*, *start=None*, ***kwargs*)

Installations metadata.

Parameters

- **data** – The type of data to get. Default is all data. If not 'all', then one or more of 'contact', 'endpoint', 'dataset', 'comment', 'deleted', 'nonPublishing'.

- **uuid** – UUID of the data node provider. This must be specified if data is anything other than 'all'.

- **query** – Query nodes. Only used when data='all'. Ignored otherwise.

References: http://www.gbif.org/developer/registry#installations

Usage:

```python
from pygbif import registry
registry.installations(limit=5)
registry.installations(query="france")
registry.installations(uuid="b77901f9-d9b0-47fa-94e0-dd96450aa2b4")
registry.installations(data='contact', uuid="b77901f9-d9b0-47fa-94e0-dd96450aa2b4
→")
registry.installations(data='contact', uuid="2e029a0c-87af-42e6-87d7-f38a50b78201
→")
registry.installations(data='endpoint', uuid="b77901f9-d9b0-47fa-94e0-dd96450aa2b4
→")
registry.installations(data='dataset', uuid="b77901f9-d9b0-47fa-94e0-dd96450aa2b4
→")
registry.installations(data='deleted')
registry.installations(data='deleted', limit=2)
registry.installations(data=['deleted','nonPublishing'], limit=2)
registry.installations(identifierType='DOI', limit=2)
```

registry.**networks**(*data='all'*, *uuid=None*, *query=None*, *identifier=None*, *identifierType=None*, *limit=100*, *start=None*, ***kwargs*)

Networks metadata.

Parameters

- **data** – The type of data to get. Default is all data.

- **uuid** – UUID of the data network provider. This must be specified if data is anything other than 'all'.

- **query** – Query networks. Only used when data='all'. Ignored otherwise.

References: http://www.gbif.org/developer/registry#networks

Returns A dict

Usage:

```python
from pygbif import registry
registry.networks(limit=5)
registry.networks(uuid='16ab5405-6c94-4189-ac71-16ca3b753df7')
registry.networks(data='endpoint', uuid='16ab5405-6c94-4189-ac71-16ca3b753df7')
```

registry.**nodes**(*data='all'*, *uuid=None*, *query=None*, *identifier=None*, *identifierType=None*, *limit=100*, *start=None*, *isocode=None*, ***kwargs*)

Nodes metadata.

Parameters

- **data** – The type of data to get. Default is all data.

- **uuid** – UUID of the data node provider. This must be specified if data is anything other than 'all'.

- **query** – Query nodes. Only used when data='all'

- **isocode** – A 2 letter country code. Only used if data='country'.

References http://www.gbif.org/developer/registry#nodes

Usage:

```python
from pygbif import registry
registry.nodes(limit=5)
registry.nodes(uuid="1193638d-32d1-43f0-a855-8727c94299d8")
registry.nodes(data='identifier', uuid="03e816b3-8f58-49ae-bc12-4e18b358d6d9")
registry.nodes(data=['identifier','organization','comment'], uuid="03e816b3-8f58-
→49ae-bc12-4e18b358d6d9")

species module

species.**name_backbone**(*name*, *rank=None*, *kingdom=None*, *phylum=None*, *clazz=None*, *order=None*, *family=None*, *genus=None*, *strict=False*, *verbose=False*, *start=None*, *limit=100*, ***kwargs*)

Lookup names in the GBIF backbone taxonomy.

Parameters

- **name** – [str] Full scientific name potentially with authorship (required)

- **rank** – [str] The rank given as our rank enum. (optional)

- **kingdom** – [str] If provided default matching will also try to match against this if no direct match is found for the name alone. (optional)

- **phylum** – [str] If provided default matching will also try to match against this if no direct match is found for the name alone. (optional)

- **class** – [str] If provided default matching will also try to match against this if no direct match is found for the name alone. (optional)

- **order** – [str] If provided default matching will also try to match against this if no direct match is found for the name alone. (optional)

- **family** – [str] If provided default matching will also try to match against this if no direct match is found for the name alone. (optional)

- **genus** – [str] If provided default matching will also try to match against this if no direct match is found for the name alone. (optional)

- **strict** – [bool] If True it (fuzzy) matches only the given name, but never a taxon in the upper classification (optional)

- **verbose** – [bool] If True show alternative matches considered which had been rejected.

A list for a single taxon with many slots (with verbose=False - default), or a list of length two, first element for the suggested taxon match, and a data.frame with alternative name suggestions resulting from fuzzy matching (with verbose=True).

If you don't get a match GBIF gives back a list of length 3 with slots synonym, confidence, and matchType='NONE'.

reference: http://www.gbif.org/developer/species#searching

Usage:

```python
from pygbif import species
species.name_backbone(name='Helianthus annuus', kingdom='plants')
species.name_backbone(name='Helianthus', rank='genus', kingdom='plants')
species.name_backbone(name='Poa', rank='genus', family='Poaceae')

# Verbose - gives back alternatives
species.name_backbone(name='Helianthus annuus', kingdom='plants', verbose=True)

# Strictness
species.name_backbone(name='Poa', kingdom='plants', verbose=True, strict=False)
species.name_backbone(name='Helianthus annuus', kingdom='plants', verbose=True,
→strict=True)

# Non-existent name
species.name_backbone(name='Aso')

# Multiple equal matches
species.name_backbone(name='Oenante')
```

species.**name_suggest**(*q=None*, *datasetKey=None*, *rank=None*, *fields=None*, *start=None*, *limit=100*, ***kwargs*)
  A quick and simple autocomplete service that returns up to 20 name usages by doing prefix matching against the scientific name. Results are ordered by relevance.

References: http://www.gbif.org/developer/species#searching

> **Parameters**
>
> - **q** – [str] Simple search parameter. The value for this parameter can be a simple word or a phrase. Wildcards can be added to the simple word parameters only, e.g. q=*puma* (Required)
>
> - **datasetKey** – [str] Filters by the checklist dataset key (a uuid, see examples)
>
> - **rank** – [str] A taxonomic rank. One of class, cultivar, cultivar_group, domain, family, form, genus, informal, infrageneric_name, infraorder, infraspecific_name, infrasubspecific_name, kingdom, order, phylum, section, series, species, strain, subclass, subfamily, subform, subgenus, subkingdom, suborder, subphylum, subsection, subseries, subspecies, subtribe, subvariety, superclass, superfamily, superorder, superphylum, suprageneric_name, tribe, unranked, or variety.
>
> **Returns** A dictionary, of results

Usage:

```python
from pygbif import species
species.name_suggest(q='Puma concolor')
x = species.name_suggest(q='Puma')
x['data']
x['hierarchy']
species.name_suggest(q='Puma', rank="genus")
species.name_suggest(q='Puma', rank="subspecies")
species.name_suggest(q='Puma', rank="species")
```

```
species.name_suggest(q='Puma', rank="infraspecific_name")
species.name_suggest(q='Puma', limit=2)
```

Changelog

0.1.4 (2015-12-05)

- Added more registry methods (#11)
- Fixed wheel to be universal for 2 and 3 (#10)
- Improved documentation a lot, autodoc methods now

0.1.1 (2015-11-03)

- Fixed distribution for pypi

0.1.0 (2015-11-02)

- First release

License

MIT
