4 Chapter 1. Install

Usage

Migrate scripts should be in one folder and with a prefix in name as index. The index is the order of execution of the scripts. eg:

```
MIGRATE_FOLDER/001_create_user_schema.py 002_create_group_schema.py 003_init_user_data.py
```

Then, run the migrate scripts by:

```
pymigrate MIGRATE_FOLDER
```

After migration is done, we can show the trace by:

```
pymigrate -t MIGRATE_FOLDER
```

When you have new change to apply to the system, just add more scripts into the MIGRATE_FOLDER, and use index for the execution order. If you just clear the system(like drop the database and recreate) and want to re-run the migrate sequence, you need clear the trace:

```
pymigrate -c MIGRATE_FOLDER
```
