PyScaffold helps you to easily setup a new Python project, it is as easy as:

```
putup my_project
```

This will create a new folder `my_project` containing a perfect *project template* with everything you need for some serious coding. After the usual:

```
python setup.py develop
```

you are all set and ready to go, meaning that in a Python shell you can do:

```
>>> from my_project.skeleton import fib
>>> fib(10)
55
```

Type `putup -h` to learn about more configuration options. PyScaffold assumes that you have [Git](#) installed and set up on your PC, meaning at least your name and email configured. The project template in `my_project` provides you with a lot of *features*. PyScaffold is compatible with Python 2.7 and Python greater equal 3.4.

---

**Note:** Currently PyScaffold 3.0 needs at least Python 3.4 due to a [bug in setuptools](#) that only affects Python 2. For the time being use PyScaffold 2.5.8 for Python 2.7 instead.

---

PyScaffold comes with a lot of elaborated features and configuration defaults to make the most common tasks in developing, maintaining and distributing your own Python package as easy as possible.

## 1.1 Configuration & Packaging

All configuration can be done in `setup.cfg` like changing the description, url, classifiers, installation requirements and so on as defined by `setuptools`. That means in most cases it is not necessary to tamper with `setup.py`. The syntax of `setup.cfg` is pretty much self-explanatory and well commented, check out this [example](#) or `setuptools`' [documentation](#).

In order to build a source, binary or wheel distribution, just run `python setup.py sdist`, `python setup.py bdist` or `python setup.py bdist_wheel`.

### Namespace Packages

Optionally, [namespace packages](#) can be used, if you are planning to distribute a larger package as a collection of smaller ones. For example, use:

```
putup my_project --package my_package --namespace com.my_domain
```

to define `my_package` inside the namespace `com.my_domain` in java-style.

### Package and Files Data

Additional data, e.g. images and text files, that reside within your package will automatically be included (`include_package_data = True` in `setup.cfg`). It is not necessary to have a `MANIFEST.in` file for this to work. Just make sure that all files are added to your repository. To read this data in your code, use:

```
from pkgutil import get_data
data = get_data('my_package', 'path/to/my/data.txt')
```

## 1.2 Complete Git Integration

Your project is already an initialised Git repository and `setup.py` uses the information of tags to infer the version of your project with the help of `setuptools_scm`. To use this feature you need to tag with the format `MAJOR.MINOR[.PATCH]`, e.g. `0.0.1` or `0.1`. Run `python setup.py --version` to retrieve the current PEP440-compliant version. This version will be used when building a package and is also accessible through `my_project.__version__`.

Unleash the power of Git by using its [pre-commit hooks](#). This feature is available through the `--pre-commit` flag. After your project's scaffold was generated, make sure `pre-commit` is installed, e.g. `pip install pre-commit`, then just run `pre-commit install`.

It goes unsaid that also a default `.gitignore` file is provided that is well adjusted for Python projects and the most common tools.

## 1.3 Sphinx Documentation

Build the documentation with `python setup.py docs` and run doctests with `python setup.py doctest` after you have [Sphinx](#) installed. Start editing the file `docs/index.rst` to extend the documentation. The documentation also works with [Read the Docs](#).

The [Numpy](#) and [Google style docstrings](#) are activated by default. Just make sure [Sphinx 1.3](#) or above is installed.

## 1.4 Unittest & Coverage

Run `python setup.py test` to run all unittests defined in the subfolder `tests` with the help of `py.test` and `pytest-runner`. Some sane default flags for `py.test` are already defined in the `[pytest]` section of `setup.cfg`. The `py.test` plugin `pytest-cov` is used to automatically generate a coverage report. It is also possible to provide additional parameters and flags on the commandline, e.g., type:

```
python setup.py test --addopts -h
```

to show the help of `py.test`.

### JUnit and Coverage HTML/XML

For usage with a continuous integration software JUnit and Coverage XML output can be activated in `setup.cfg`. Use the flag `--travis` to generate templates of the [Travis](#) configuration files `.travis.yml` and `tests/travis_install.sh` which even features the coverage and stats system [Coveralls](#). In order to use the virtualenv management and test tool [Tox](#) the flag `--tox` can be specified. If you are using [GitLab](#) you can get a default `.gitlab-ci.yml` also running `pytest-cov` with the flag `--gitlab`.

## Managing test environments with tox

Run `tox` to generate test virtual environments for various python environments defined in the generated `tox.ini`. Testing and building *sdist*s for python 2.7 and python 3.4 is just as simple with tox as:

```
tox -e py27,py34
```

Environments for tests with the the static code analyzers pyflakes and pep8 which are bundled in `flake8` are included as well. Run it explicitly with:

```
tox -e flake8
```

With tox, you can use the `--recreate` flag to force tox to create new environments. By default, PyScaffold's tox configuration will execute tests for a variety of python versions. If an environment is not available on the system the tests are skipped gracefully. You can rely on the [tox documentation](#) for detailed configuration options.

## 1.5 Management of Requirements & Licenses

Installation requirements of your project can be defined inside `setup.cfg`, e.g. `install_requires = numpy; scipy`. To avoid package dependency problems it is common to not pin installation requirements to any specific version, although minimum versions, e.g. `sphinx>=1.3`, or maximum versions, e.g. `pandas<0.12`, are used sometimes.

More specific installation requirements should go into `requirements.txt`. This file can also be managed with the help of `pip compile` from `pip-tools` that basically pins packages to the current version, e.g. `numpy==1.13.1`. The packages defined in `requirements.txt` can be easily installed with:

```
pip install -r requirements.txt
```

All licenses from [choosealicense.com](#) can be easily selected with the help of the `--license` flag.

## 1.6 Extensions

PyScaffold comes with several extensions:

- Create a [Django project](#) with the flag `--django` which is equivalent to `django-admin.py startproject my_project` enhanced by PyScaffold's features.
- With the help of [Cookiecutter](#) it is possible to further customize your project setup with a template tailored for PyScaffold. Just use the flag `--cookiecutter TEMPLATE` to use a cookiecutter template which will be refined by PyScaffold afterwards.
- ... and many more like `--gitlab` to create the necessary files for [GitLab](#).

There is also documentation about *writing extensions*.

## 1.7 Easy Updating

Keep your project's scaffold up-to-date by applying `putput --update my_project` when a new version of PyScaffold was released. An update will only overwrite files that are not often altered by users like `setup.py`. To update all files use `--update --force`. An existing project that was not setup with PyScaffold can be converted

with `putup --force existing_project`. The force option is completely safe to use since the git repository of the existing project is not touched! Also check out if *configuration options* in `setup.cfg` have changed.

### 1.7.1 Updates from PyScaffold 2

Since the overall structure of a project set up with PyScaffold 2 differs quite much from a project generated with PyScaffold 3 it is not possible to just use the `--update` parameter. Still with some manual efforts an update from a scaffold generated with PyScaffold 2 to PyScaffold 3's scaffold is quite easy. Assume the name of our project is `old_project` with a package called `old_package` and no namespaces then just:

1. make sure your worktree is not dirty, i.e. commit all your changes,
2. run `putup old_project --force --no-skeleton -p old_package` to generate the new structure inplace and `cd` into your project,
3. move with `git mv old_package/* src/old_package/ --force` your old package over to the new `src` directory,
4. check `git status` and add untracked files from the new structure,
5. use `git difftool` to check all overwritten files, especially `setup.cfg`, and transfer custom configurations from the old structure to the new,
6. check if `python setup.py test sdist` works and commit your changes.

### 1.7.2 Adding features

With the help of an experimental updating functionality it is also possible to add additional features to your existing project scaffold. If a scaffold lacking `.travis.yml` was created with `putup my_project` it can later be added by issuing `putup --update my_project --travis`. For this to work, PyScaffold stores all options that were initially used to put up the scaffold under the `[pyscaffold]` section in `setup.cfg`. Be aware that right now PyScaffold provides no way to remove a feature which was once added.

### 2.1 Requirements

The installation of PyScaffold only requires a recent version of [setuptools](#), i.e. at least version 30.3.0, as well as a working installation of [Git](#). Especially Windows users should make sure that the command `git` is available on the command line. Otherwise, check and update your `PATH` environment variable or run PyScaffold from the *Git Bash*.

Additionally, if you want to create a Django project or want to use cookiecutter:

- [Django](#)
- [Cookiecutter](#)

---

**Note:** It is recommended to use an isolated environment as provided by [virtualenv](#) or even better [Anaconda](#) for your work with Python in general.

---

### 2.2 Installation

Make sure you have `pip` installed, then simply type:

```
pip install --upgrade pyscaffold
```

to get the latest stable version. The most recent development version can be installed with:

```
pip install --pre --upgrade pyscaffold
```

Using `pip` also has the advantage that all requirements are automatically installed.

If you want to install PyScaffold with all features like Django and cookiecutter support, run:

```
pip install --upgrade pyscaffold[ALL]
```

PyScaffold is also available at [conda-forge](#) and thus can be installed with `conda`:

```
conda install -c conda-forge pyscaffold
```

## 2.3 Additional Requirements

If you run commands like `python setup.py test` and `python setup.py docs` within your project, some additional requirements like `py.test` will be installed automatically as *egg*-files inside the `.eggs` folder. This is quite comfortable but can be confusing because these packages won't be available to other packages inside your virtual environment. In order to avoid this just install following packages inside your virtual environment before you run `setup.py` commands like *doc* and *test*:

- `Sphinx`
- `py.test`
- `pytest-cov`

---

## Examples

---

Just a few examples to get you an idea of how easy PyScaffold is to use:

**putup my\_little\_project** The simplest way of using PyScaffold. A directory `my_little_project` is created with a Python package named exactly the same. The MIT license will be used.

**putup skynet -l gpl3 -d "Finally, the ultimate AI!" -u http://sky.net** This will create a project and package named `skynet` licensed under the GPL3. The `summary` inside `setup.cfg` is directly set to “Finally, the ultimate AI!” and the homepage to `http://sky.net`.

**putup Scikit-Gravity -p skgravity -l new-bsd** This will create a project named `Scikit-Gravity` but the package will be named `skgravity` with license new-BSD.

**putup youtub --django --pre-commit -d "Ultimate video site for hot tub fans"**  
This will create a web project and package named `youtub` that also includes the files created by Django’s `django-admin`. The summary description in `setup.cfg` will be set and a file `.pre-commit-config.yaml` is created with a default setup for `pre-commit`.

**putup thoroughly\_tested --tox --travis** This will create a project and package `thoroughly_tested` with files `tox.ini` and `.travis.yml` for `Tox` and `Travis`.

**putup my\_zope\_subpackage --namespace zope -l gpl3** This will create a project and subpackage named `my_zope_subpackage` in the namespace `zope`. To be honest, there is really only the `Zope` project that comes to my mind which is using this exotic feature of Python’s packaging system. Chances are high, that you will never ever need a namespace package in your life.

## CHAPTER 4

---

### Configuration

---

Projects set up with PyScaffold feature an easy package configuration with `setup.cfg`. Check out the example below as well as documentation of [setuptools](#).

```
[metadata]
name = my_project
description = A test project that was set up with PyScaffold
author = Florian Wilhelm
author-email = Florian.Wilhelm@blue-yonder.com
license = MIT
url = https://...
long-description = file: README.rst
platforms = any
classifiers =
    Development Status :: 5 - Production/Stable

# PyScaffold's parameters when the project was created.
# This will be used when updating. Do not change!
version = 3.0
```

```
package = my_package
extensions =
    namespace
namespace = ns1.ns2
```

---

## Extending PyScaffold

---

PyScaffold is carefully designed to cover the essentials of authoring and distributing Python packages. Most of time, tweaking `putup` options is enough to ensure proper configuration of a project. However, for advanced use cases a deeper level of programmability may be required and PyScaffold's extension systems provides this.

PyScaffold can be extended at runtime by other Python packages. Therefore it is possible to change the behavior of the `putup` command line tool without changing the PyScaffold code itself. In order to explain how this mechanism works, the following sections define a few important concepts and present a comprehensive guide about how to create custom extensions.

Additionally, *Cookiecutter templates* can also be used but writing a native PyScaffold extension is the preferred way.

### 5.1 Project Structure Representation

Each Python package project is internally represented by PyScaffold as a tree data structure, that directly relates to a directory entry in the file system. This tree is implemented as a simple (and possibly nested) `dict` in which keys indicate the path where files will be generated, while values indicate their content. For instance, the following dict:

```
{
  'project': {
    'folder': {
      'file.txt': 'Hello World!',
      'another-folder': {'empty-file.txt': ''}
    }
  }
}
```

represents a `project/folder` directory in the file system containing two entries. The first entry is a file named `file.txt` with content `Hello World!` while the second entry is a sub-directory named `another-folder`. In turn, `another-folder` contains an empty file named `empty-file.txt`.

Additionally, tuple values are also allowed in order to specify some useful metadata. In this case, the first element of the tuple is the file content. For example, the dict:

```
{
  'project': {
    'namespace': {
      'module.py': ('print("Hello World!)", helpers.NO_OVERWRITE)
    }
  }
}
```

represents a `project/namespace/module.py` file with content `print("Hello World!")`, that will not be overwritten if already exists.

This tree representation is often referred in this document as **project structure** or simply **structure**.

## 5.2 Scaffold Actions

PyScaffold organizes the generation of a project into a series of steps with well defined purposes. Each step is called **action** and is implemented as a simple function that receives two arguments: a project structure and a dict with options (some of them parsed from command line arguments, other from default values).

An action **MUST** return a tuple also composed by a project structure and a dict with options. The return values, thus, are usually modified versions of the input arguments. Additionally an action can also have side effects, like creating directories or adding files to version control. The following pseudo-code illustrates a basic action:

```
def action(project_structure, options):
    new_struct, new_opts = modify(project_structure, options)
    some_side_effect()
    return new_struct, new_opts
```

The output of each action is used as the input of the subsequent action, and initially the structure argument is just an empty dict. Each action is uniquely identified by a string in the format `<module name>:<function name>`, similarly to the convention used for a `setuptools` entry point. For example, if an action is defined in the `action` function of the `extras.py` file that is part of the `pyscaffoldext.contrib` project, the **action identifier** is `pyscaffoldext.contrib.extras:action`.

By default, the sequence of actions taken by PyScaffold is:

1. `pyscaffold.api:get_default_options`
2. `pyscaffold.api:verify_options_consistency`
3. `pyscaffold.structure:define_structure`
4. `pyscaffold.structure:apply_update_rules`
5. `pyscaffold.structure:create_structure`
6. `pyscaffold.api:init_git`

The project structure is usually empty until **define\_structure**. This action just loads the in-memory dict representation, that is only written to disk by the **create\_structure** action.

Note that, this sequence varies according to the command line options. To retrieve an updated list, please use `putup --list-actions` or `putup --dry-run`.

## 5.3 What are Extensions?

From the standpoint of PyScaffold, an extension is just a class inheriting from *Extension* overriding and implementing certain methods. These methods allow inject actions at arbitrary positions in the aforementioned list. Furthermore, extensions can also remove actions.

## 5.4 Creating an Extension

In order to create an extension it is necessary to write a class that inherits from *Extension* and implements the method *activate* that receives a list of actions, registers a custom action that will be called later and returns a modified version of the list of actions:

```
from ..api import Extension
from ..api import helpers

class MyExtension(Extension):
    """Help text on commandline when running putup -h"""
    def activate(self, actions):
        """Activate extension

        Args:
            actions (list): list of actions to perform

        Returns:
            list: updated list of actions
        """
        actions = helpers.register(actions, self.action, after='create_structure')
        actions = helpers.unregister(actions, 'init_git')
        return actions

    def action(self, struct, opts):
        """Perform some actions that modifies the structure and options

        Args:
            struct (dict): project representation as (possibly) nested
                :obj:`dict`.
            opts (dict): given options, see :obj:`create_project` for
                an extensive list.

        Returns:
            struct, opts: updated project representation and options
        """
        ....
        return new_actions, new_opts
```

### 5.4.1 Action List Helper Methods

As implied by the previous example, the *helpers* module provides a series of useful functions and makes it easier to manipulate the action list, by using *register* and *unregister*.

Since the action order is relevant, the first function accepts special keyword arguments (*before* and *after*) that should be used to place the extension actions precisely among the default actions. The value of these arguments can be presented in 2 different forms:

```
helpers.register(actions, hook1, before='define_structure')
helpers.register(actions, hook2, after='pyscaffold.structure:create_structure')
```

The first form uses as a position reference the first action with a matching name, regardless of the module. Accordingly, the second form tries to find an action that matches both the given name and module. When no reference is given, *register* assumes as default position `after='pyscaffold.structure:define_structure'`. This position is special since most extensions are expected to create additional files inside the project. Therefore, it is possible to easily amend the project structure before it is materialized by `create_structure`.

The *unregister* function accepts as second argument a position reference which can similarly present the module name:

```
helpers.unregister(actions, 'init_git')
helpers.unregister(actions, 'pyscaffold.api:init_git')
```

---

**Note:** These functions **DO NOT** modify the actions list, instead they return a new list with the changes applied.

---

## 5.4.2 Structure Helper Methods

PyScaffold also provides extra facilities to manipulate the project structure. The following functions are accessible through the *helpers* module:

- *merge*
- *ensure*
- *reject*

The first function can be used to deep merge a dictionary argument with the current representation of the to-be-generated directory tree, automatically considering any metadata present in tuple values. On the other hand, the last two functions can be used to ensure a single file is present or absent in the current representation of the project structure, automatically handling parent directories.

---

**Note:** Similarly to the actions list helpers, these functions also **DO NOT** modify the project structure. Instead they return a new structure with the changes applied.

---

The following example illustrates the implementation of a `AwesomeFiles` extension which defines the `define_awesome_files` action:

```
from ..api import Extension
from ..api import helpers

MY_AWESOME_FILE = """\
# -*- coding: utf-8 -*-
from __future__ import print_function

__author__ = "{author}"
__copyright__ = "{author}"
__license__ = "{license}"

def awesome():
    return "Awesome!"
"""
```

```

MY_AWESOME_TEST = """\
import pytest
from {qual_pkg}.awesome import awesome

def test_awesome():
    assert awesome() == "Awesome!"
"""

class AwesomeFiles(Extension):
    """Adding some additional awesome files"""
    def activate(self, actions):
        return helpers.register(actions, self.define_awesome_files)

    def define_awesome_files(self, struct, opts):
        struct = helpers.merge(struct, {
            'project': {
                'package': {
                    'awesome.py': MY_AWESOME_FILE.format(**opts)
                },
                'tests': {
                    'awesome_test.py': (
                        MY_AWESOME_TEST.format(**opts),
                        helpers.NO_OVERWRITE
                    )
                }
            }
        })

        struct['.python-version'] = ('3.6.1', helpers.NO_OVERWRITE)

        for filename in ['awesome_file1', 'awesome_file2']:
            struct = helpers.ensure(
                struct, [opts['project'], 'awesome', filename],
                content='AWESOME!', update_rule=helpers.NO_CREATE)
            # The second argument is the file path, represented by a
            # list of file parts or a string.
            # Alternatively in this example:
            # path = '{project}/awesome/{filename}'.format(
            #     filename=filename, **opts)

            # The `reject` can be used to avoid default files being generated.
            struct = helpers.reject(
                struct, '{project}/{package}/skeleton.py'.format(**opts))
            # Alternatively in this example:
            # path = [opts['project'], opts['package'], 'skeleton.py'])

            # It is import to remember the return values
        return struct, opts

```

**Note:** The `project` and `package` options should be used to provide the correct location of the files relative to the current working directory.

As shown by the previous example, the `helpers` module also presents constants that can be used as metadata. The `NO_OVERWRITE` flag avoids an existing file to be overwritten when `putup` is used in update mode. Similarly, `NO_CREATE` avoids creating a file from template in update mode, even if it does not exist.

For more sophisticated extensions which need to read and parse their own command line arguments it is necessary to override `activate` that receives an `argparse.ArgumentParser` argument. This object can then be modified in order to add custom command line arguments that will later be stored in the `opts` dictionary. Just remember the convention that after the command line arguments parsing, the extension function should be stored under the `extensions` attribute (a list) of the `argparse` generated object. For reference check out the implementation of the namespace extension,

### 5.4.3 Activating Extensions

PyScaffold extensions are not activated by default. Instead, it is necessary to add a CLI option to do it. This is possible by setting up a `setuptools` entry point under the `pyscaffold.cli` group. This entry point should point to our extension class, e.g. `AwesomeFiles` like defined above. If you for instance use a scaffold generated by PyScaffold to write a PyScaffold extension (we hope you do ;-), you would add the following to the `entry_points` variable in `setup.py`:

```
entry_points = """
[pyscaffold.cli]
awesome_files = your_package.your_module:AwesomeFiles
"""
```

## 5.5 Examples

Some options for the `putup` command are already implemented as extensions and can be used as reference implementation:

### 5.5.1 Namespace Extension

```
# -*- coding: utf-8 -*-
"""
Extension that adjust project file tree to include a namespace package.

This extension adds a namespace option to
:obj:`~pyscaffold.api.create_project` and provides correct values for the
options root_pkg and namespace_pkg to the following functions in the
action list.
"""
from __future__ import absolute_import

        '.gitlab-ci.yml': (gitlab_ci(opts), helpers.NO_OVERWRITE)
    }

    return helpers.merge(struct, {opts['project']: files}), opts
```

## 5.6 Conventions for Community Extensions

In order to make it easy to find PyScaffold extensions, community packages should be namespaced as in `pyscaffoldext.{$EXTENSION}` (where `{$EXTENSION}` is the name of the extension being developed). Although this naming convention slightly differs from [PEP423](#), it is close enough and shorter.

Similarly to `sphinxcontrib-*` packages, names registered in PyPI should contain a dash `-`, instead of a dot `..`. This way, third-party extension development can be easily bootstrapped with the command:

```
putput pyscaffoldext-{$EXTENSION} -p {$EXTENSION} --namespace pyscaffoldext
```

## 5.7 Final Considerations

When writing extensions, it is important to be consistent with the default PyScaffold behavior. In particular, PyScaffold uses a `pretend` option to indicate when the actions should not run but instead just indicate the expected results to the user, that **MUST** be respected.

The `pretend` option is automatically observed for files registered in the project structure representation, but complex actions may require specialized coding. The `helpers` module provides a special `logger` object useful in these situations. Please refer to *No Skeleton Extension* for a practical example.

Other options that should be considered are the `update` and `force` flags. See `pyscaffold.api.create_project` for a list of available options.

---

## Embedding PyScaffold

---

PyScaffold is expected to be used from terminal, via `putup` command line application. It is, however, possible to write an external script or program that embeds PyScaffold and use it to perform some custom actions.

The public Python API is exposed by the `pyscaffold.api` module, which contains the main function `create_project`. The following example illustrates a typical embedded usage of PyScaffold:

```
import logging

from pyscaffold.api import create_project
from pyscaffold.extensions import tox, travis, namespace
from pyscaffold.log import DEFAULT_LOGGER as LOGGER_NAME

logging.getLogger(LOGGER_NAME).setLevel(logging.INFO)

create_project(project="my-proj-name", author="Your Name",
              namespace="some.namespace", license="mit",
              extensions=[tox.extend_project,
                        travis.extend_project,
                        namespace.extend_project])
```

Note that no built-in extension (e.g. `tox`, `travis` and `namespace` support) is activated by default. The `extensions` option should be manually populated when convenient.

PyScaffold uses the logging infrastructure from Python standard library, and emits notifications during its execution. Therefore, it is possible to control which messages are logged by properly setting the log level (internally, most of the messages are produced under the `INFO` level). By default, a `StreamHandler` is attached to the logger, however it is possible to replace it with a custom handler using `logging.Logger.removeHandler` and `logging.Logger.addHandler`. The logger object is available under the `logger` variable of the `pyscaffold.log` module. The default handler is available under the `handler` property of the `logger` object.

---

## Cookiecutter templates with PyScaffold

---

`Cookiecutter` is a flexible utility that allows the definition of templates for a diverse range of software projects. On the other hand, `PyScaffold` is focused in a good out-of-the-box experience for developing distributable Python packages (exclusively). Despite the different objectives, it is possible to combine the power of both tools to create a custom Python project setup. For instance, the following command creates a new package named `mypkg`, that uses a `Cookiecutter` template, but is enhanced by `PyScaffold` features:

```
$ putup mypkg --cookiecutter gh:audreyr/cookiecutter-pypackage
```

---

**Note:** Although using `Cookiecutter` templates is a viable solution to customize a project that was set up with `PyScaffold`, the recommended way is to help improve `PyScaffold` by contributing an *extension*.

---

### 7.1 Suitable templates

Note that `PyScaffold` will overwrite some files generated by `Cookiecutter`, like `setup.py`, the `__init__.py` file under the package folder and most of the `docs` folder, in order to provide `setuptools_scm` and `sphinx` integration. Therefore not all `Cookiecutter` templates are suitable for this approach.

Ideally, interoperable templates should focus on the file structure inside the package folder instead of packaging or distributing, since `PyScaffold` already handles it under-the-hood. However, the following files can be safely generated by a template (will not be overwritten):

```
<project root>/docs/index.rst
<project root>/tests/conftest.py
<project root>/README.rst
<project root>/AUTHORS.rst
<project root>/LICENSE.txt
<project root>/CHANGES.rst
<project root>/setup.cfg
<project root>/requirements.txt
```

```
<project root>/test-requirements.txt  
<project root>/coveragerc
```

In addition, PyScaffold runs Cookiecutter with the `--no-input` flag activated and thus the user is not prompted for manual configuration. Instead, PyScaffold injects the following parameters:

```
author  
email  
project_name  
package_name  
project_short_description
```

Accordingly, the template file structure should be similar to:

```
cookiecutter-something/  
└─ {{cookiecutter.project_name}}/  
    └─ {{cookiecutter.package_name}}/  
        └─ ...
```

See [Cookiecutter](#) for more information about template creation.

PyScaffold was started by [Blue Yonder](#) developers to help automating and standardizing the process of project setups. Nowadays it is a pure community project and you are very welcome to join in our effort if you would like to contribute.

### 8.1 Chat

Join our [chat](#) to get in direct contact with the developers of PyScaffold.

### 8.2 Issue Reports

If you experience bugs or in general issues with PyScaffold, please file an issue report on our [issue tracker](#).

### 8.3 Code Contributions

#### 8.3.1 Submit an issue

Before you work on any non-trivial code contribution it's best to first create an issue report to start a discussion on the subject. This often provides additional considerations and avoids unnecessary work.

#### 8.3.2 Create an environment

Before you start coding we recommend to install [Miniconda](#) which allows to setup a dedicated development environment named `pyscaffold` with:

```
conda create -n pyscaffold python=3 six virtualenv pytest pytest-cov
```

Then activate the environment `pyscaffold` with:

```
source activate pyscaffold
```

### 8.3.3 Clone the repository

1. Create a [Gitub account](#) if you do not already have one.
2. Fork the [project repository](#): click on the *Fork* button near the top of the page. This creates a copy of the code under your account on the GitHub server.
3. Clone this copy to your local disk:

```
git clone git@github.com:YourLogin/pyscaffold.git
```

4. Run `python setup.py egg_info --egg-base .` after a fresh checkout. This will generate some critically needed files. Typically after that, you should run `python setup.py develop` to be able run `putup`.
5. Create a branch to hold your changes:

```
git checkout -b my-feature
```

and start making changes. Never work on the master branch!

6. Start your work on this branch. When you're done editing, do:

```
git add modified_files
git commit
```

to record your changes in Git, then push them to GitHub with:

```
git push -u origin my-feature
```

7. Please check that your changes don't break any unit tests with:

```
python setup.py test
```

or even a more thorough test with `tox` after having installed `tox` with `pip install tox`. Don't forget to also add unit tests in case your contribution adds an additional feature and is not just a bugfix.

8. Use `flake8` to check your code style.
9. Add yourself to the list of contributors in `AUTHORS.rst`.
10. Go to the web page of your PyScaffold fork, and click "Create pull request" to send your changes to the maintainers for review. Find more detailed information [creating a PR](#).

## 11.1 Current version

### 11.1.1 Version 3.0.1, 2018-02-13

- Fix confusing error message when `python setup.py docs` and Sphinx is not installed, issue #142
- Fix 'unknown' version in case project name differs from the package name, issue #141
- Fix missing `file:` attribute in long-description of `setup.cfg`
- Fix `sphinx-apidoc` invocation problem with Sphinx 1.7

## 11.2 Older versions

### 11.2.1 Version 3.0, 2018-01-07

- Improved Python API thanks to an extension system
- Dropped `pbr` in favor of `setuptools >= 30.3.0`
- Updated `setuptools_scm` to `v1.15.6`
- Changed `my_project/my_package` to recommended `my_project/src/my_package` structure
- Renamed `CHANGES.rst` to more standard `CHANGELOG.rst`
- Added `platforms` parameter in `setup.cfg`
- Call Sphinx `api-doc` from `conf.py`, issue #98
- Included `six 1.11.0` as contrib sub-package
- Added `CONTRIBUTING.rst`
- Removed `test-requirements.txt` from template

- Added support for GitLab
- License change from New BSD to MIT
- FIX: Support of git submodules, issue #98
- Support of Cython extensions, issue #48
- Removed redundant `--with-` from most command line flags
- Prefix `n` was removed from the `local_version` string of dirty versions
- Added a `--pretend` flag for easier development of extensions
- Added a `--verbose` flag for more output what PyScaffold is doing
- Use `pytest-runner 3.0` as contrib package
- Added a `--no-skeleton` flag to omit the creation of `skeleton.py`
- Save parameters used to create project scaffold in `setup.cfg` for later updating

A special thanks goes to Anderson Bravalheri for his awesome support and [inovex](#) for sponsoring this release.

### 11.2.2 Version 2.5.8, 2017-09-10

- Use `sphinx.ext.imgmath` instead of `sphinx.ext.mathjax`
- Added `--with-gitlab-ci` flag for GitLab CI support
- Fix Travis install template dirties git repo, issue #107
- Updated `setuptools_scm` to version 1.15.6
- Updated `pbr` to version 3.1.1

### 11.2.3 Version 2.5.7, 2016-10-11

- Added encoding to `__init__.py`
- Few doc corrections in `setup.cfg`
- `[tool:pytest]` instead of `[pytest]` in `setup.cfg`
- Updated skeleton
- Switch to Google Sphinx style
- Updated `setuptools_scm` to version 1.13.1
- Updated `pbr` to version 1.10.0

### 11.2.4 Version 2.5.6, 2016-05-01

- Prefix error message with `ERROR:`
- Suffix of untagged commits changed from `{version}-{hash}` to `{version}-n{hash}`
- Check if package identifier is valid
- Added log level command line flags to the skeleton
- Updated `pbr` to version 1.9.1

- Updated `setuptools_scm` to version 1.11.0

### 11.2.5 Version 2.5.5, 2016-02-26

- Updated `pbr` to master at 2016-01-20
- Fix `sdist` installation bug when no `git` is installed, issue #90

### 11.2.6 Version 2.5.4, 2016-02-10

- Fix problem with `fibonacci` terminal example
- Update `setuptools_scm` to v1.10.1

### 11.2.7 Version 2.5.3, 2016-01-16

- Fix classifier metadata (`classifiers` to `classifier` in `setup.cfg`)

### 11.2.8 Version 2.5.2, 2016-01-02

- Fix `is_git_installed`

### 11.2.9 Version 2.5.1, 2016-01-01

- Fix: Do some sanity checks first before gathering default options
- Updated `setuptools_scm` to version 1.10.0

### 11.2.10 Version 2.5, 2015-12-09

- Usage of `test-requirements.txt` instead of `tests_require` in `setup.py`, issue #71
- Removed `--with-numpydoc` flag since this is now included by default with `sphinx.ext.napoleon` in Sphinx 1.3 and above
- Added small template for `unittest`
- Fix for the example skeleton file when using namespace packages
- Fix typo in `devpi:upload` section, issue #82
- Include `pbr` and `setuptools_scm` in PyScaffold to avoid dependency problems, issue #71 and #72
- Cool logo was designed by Eva Schmücker, issue #66

### 11.2.11 Version 2.4.4, 2015-10-29

- Fix problem with bad upload of version 2.4.3 to PyPI, issue #80

### 11.2.12 Version 2.4.3, 2015-10-27

- Fix problem with version numbering if `setup.py` is not in the root directory, issue #76

### 11.2.13 Version 2.4.2, 2015-09-16

- Fix version conflicts due to too tight pinning, issue #69

### 11.2.14 Version 2.4.1, 2015-09-09

- Fix installation with additional requirements `pyscaffold[ALL]`
- Updated pbr version to 1.7

### 11.2.15 Version 2.4, 2015-09-02

- Allow different `py.test` options when invoking with `py.test` or `python setup.py test`
- Check if Sphinx is needed and add it to `setup_requires`
- Updated pre-commit plugins
- Replaced `pytest-runner` by an improved version
- Let pbr do `sphinx-apidoc`, removed from `conf.py`, issue #65

---

**Note:** Due to the switch to a modified `pytest-runner` version it is necessary to update `setup.cfg`. Please check the *example*.

---

### 11.2.16 Version 2.3, 2015-08-26

- Format of `setup.cfg` changed due to usage of pbr, issue #59
- Much cleaner `setup.py` due to usage of pbr, issue #59
- PyScaffold can be easily called from another script, issue #58
- Internally dictionaries instead of namespace objects are used for options, issue #57
- Added a section for `devpi` in `setup.cfg`, issue #62

---

**Note:** Due to the switch to pbr, it is necessary to update `setup.cfg` according to the new syntax.

---

### 11.2.17 Version 2.2.1, 2015-06-18

- FIX: Removed putup console script in `setup.cfg` template

### 11.2.18 Version 2.2, 2015-06-01

- Allow recursive inclusion of data files in `setup.cfg`, issue #49
- Replaced hand-written PyTest runner by `pytest-runner`, issue #47
- Improved default `README.rst`, issue #51
- Use `tests/conftest.py` instead of `tests/__init__.py`, issue #52

- Use `setuptools_scm` for versioning, issue #43
- Require `setuptools>=9.0`, issue #56
- Do not create `skeleton.py` during an update, issue #55

---

**Note:** Due to the switch to `setuptools_scm` the following changes apply:

- use `python setup.py --version` instead of `python setup.py version`
  - `git archive` can no longer be used for packaging (and was never meant for it anyway)
  - initial tag `v0.0` is no longer necessary and thus not created in new projects
  - tags do no longer need to start with `v`
- 

### 11.2.19 Version 2.1, 2015-04-16

- Use alabaster as default Sphinx theme
- Parameter `data_files` is now a section in `setup.cfg`
- Allow definition of `extras_require` in `setup.cfg`
- Added a `CHANGES.rst` file for logging changes
- Added support for cookiecutter
- FIX: Handle an empty Git repository if necessary

### 11.2.20 Version 2.0.4, 2015-03-17

- Typo and wrong Sphinx usage in the RTD documentation

### 11.2.21 Version 2.0.3, 2015-03-17

- FIX: Removed misleading `include_package_data` option in `setup.cfg`
- Allow selection of a proprietary license
- Updated some documentations
- Added `-U` as short parameter for `-update`

### 11.2.22 Version 2.0.2, 2015-03-04

- FIX: Version retrieval with `setup.py install`
- `argparse` example for version retrieval in `skeleton.py`
- FIX: `import my_package` should be quiet (`verbose=False`)

### 11.2.23 Version 2.0.1, 2015-02-27

- FIX: Installation bug under Windows 7

### 11.2.24 Version 2.0, 2015-02-25

- Split configuration and logic into `setup.cfg` and `setup.py`
- Removed `.pre` from version string (newer PEP 440)
- FIX: Sphinx now works if package name does not equal project name
- Allow namespace packages with `--with-namespace`
- Added a `skeleton.py` as a `console_script` template
- Set `v0.0` as initial tag to support PEP440 version inference
- Integration of the Versioneer functionality into `setup.py`
- Usage of `data_files` configuration instead of `MANIFEST.in`
- Allow configuration of `package_data` in `setup.cfg`
- Link from Sphinx docs to `AUTHORS.rst`

### 11.2.25 Version 1.4, 2014-12-16

- Added `numpydoc` flag `--with-numpydoc`
- Fix: Add `django` to requirements if `--with-django`
- Fix: Don't overwrite `index.rst` during update

### 11.2.26 Version 1.3.2, 2014-12-02

- Fix: path of Travis install script

### 11.2.27 Version 1.3.1, 2014-11-24

- Fix: `--with-tox` tuple bug #28

### 11.2.28 Version 1.3, 2014-11-17

- Support for Tox (<https://tox.readthedocs.org/>)
- `flake8`: exclude some files
- Usage of UTF8 as file encoding
- Fix: create non-existent files during update
- Fix: unit tests on MacOS
- Fix: unit tests on Windows
- Fix: Correct version when doing `setup.py` install

### 11.2.29 Version 1.2, 2014-10-13

- Support pre-commit hooks (<http://pre-commit.com/>)

### 11.2.30 Version 1.1, 2014-09-29

- Changed COPYING to LICENSE
- Support for all licenses from <http://choosealicense.com/>
- Fix: Allow update of license again
- Update to Versioneer 0.12

### 11.2.31 Version 1.0, 2014-09-05

- Fix when overwritten project has a git repository
- Documentation updates
- License section in Sphinx
- Django project support with `--with-django` flag
- Travis project support with `--with-travis` flag
- Replaced sh with own implementation
- Fix: new *git describe* version to PEP440 conversion
- `conf.py` improvements
- Added source code documentation
- Fix: Some Python 2/3 compatibility issues
- Support for Windows
- Dropped Python 2.6 support
- Some classifier updates

### 11.2.32 Version 0.9, 2014-07-27

- Documentation updates due to RTD
- Added a `--force` flag
- Some cleanups in `setup.py`

### 11.2.33 Version 0.8, 2014-07-25

- Update to Versioneer 0.10
- Moved `sphinx-apidoc` from `setup.py` to `conf.py`
- Better support for *make html*

### 11.2.34 Version 0.7, 2014-06-05

- Added Python 3.4 tests and support
- Flag `--update` updates only some files now
- Usage of `setup_requires` instead of `six` code

### 11.2.35 Version 0.6.1, 2014-05-15

- Fix: Removed six dependency in setup.py

### 11.2.36 Version 0.6, 2014-05-14

- Better usage of six
- Return non-zero exit status when doctests fail
- Updated README
- Fixes in Sphinx Makefile

### 11.2.37 Version 0.5, 2014-05-02

- Simplified some Travis tests
- Nicer output in case of errors
- Updated PyScaffold's own setup.py
- Added `--junit_xml` and `--coverage_xml/html` option
- Updated `.gitignore` file

### 11.2.38 Version 0.4.1, 2014-04-27

- Problem fixed with `pytest-cov` installation

### 11.2.39 Version 0.4, 2014-04-23

- PEP8 and PyFlakes fixes
- Added `--version` flag
- Small fixes and cleanups

### 11.2.40 Version 0.3, 2014-04-18

- PEP8 fixes
- More documentation
- Added update feature
- Fixes in setup.py

### 11.2.41 Version 0.2, 2014-04-15

- Checks when creating the project
- Fixes in COPYING
- Usage of `sh` instead of `GitPython`

- PEP8 fixes
- Python 3 compatibility
- Coverage with Coverall.io
- Some more unittests

#### **11.2.42 Version 0.1.2, 2014-04-10**

- Bugfix in Manifest.in
- Python 2.6 problems fixed

#### **11.2.43 Version 0.1.1, 2014-04-10**

- Unittesting with Travis
- Switch to string.Template
- Minor bugfixes

#### **11.2.44 Version 0.1, 2014-04-03**

- First release

## 12.1 pyscaffold package

### 12.1.1 Subpackages

#### pyscaffold.api package

#### Submodules

#### pyscaffold.api.helpers module

Useful functions for manipulating the action list and project structure.

`pyscaffold.api.helpers.NO_CREATE = 1`  
Do not create the file during an update

`pyscaffold.api.helpers.NO_OVERWRITE = 0`  
Do not overwrite an existing file during update (still created if not exists)

`pyscaffold.api.helpers.ensure` (*struct*, *path*, *content=None*, *update\_rule=None*)  
Ensure a file exists in the representation of the project tree with the provided content. All the parent directories are automatically created.

#### Parameters

- **struct** (*dict*) – project representation as (possibly) nested *dict*. See *merge*.
- **path** (*str or list*) – file path relative to the structure root. The directory separator should be / (forward slash) if present. Alternatively, a list with the parts of the path can be provided, ordered from the structure root to the file itself. The following examples are equivalent:

```
'docs/api/index.html'  
['docs', 'api', 'index.html']
```

- **content** (*str*) – file text contents
- **update\_rule** – see *FileOp*, None by default

**Returns** updated project tree representation

**Return type** `dict`

---

**Note:** Use an empty string as content to ensure a file is created empty.

---

`pyscaffold.api.helpers.get_id` (*function*)

Given a function, calculate its identifier.

A identifier is a string in the format `<module name>:<function name>`, similarly to the convention used for setuptools entry points.

---

**Note:** This function does not return a Python 3 `__qualname__` equivalent. If the function is nested inside another function or class, the parent name is ignored.

---

**Parameters** **function** (*callable*) – function object

**Returns** identifier

**Return type** `str`

`pyscaffold.api.helpers.logger` = `<pyscaffold.log.ReportLogger object>`

Logger wrapper, that provides methods like *report*. See *ReportLogger*.

`pyscaffold.api.helpers.merge` (*old, new*)

Merge two dict representations for the directory structure.

Basically a deep dictionary merge, except from the leaf update method.

**Parameters**

- **old** (*dict*) – directory descriptor that takes low precedence during the merge
- **new** (*dict*) – directory descriptor that takes high precedence during the merge

The directory tree is represented as a (possibly nested) dictionary. The keys indicate the path where a file will be generated, while the value indicates the content. Additionally, tuple values are allowed in order to specify the rule that will be followed during an `update` operation (see *FileOp*). In this case, the first element is the file content and the second element is the update rule. For example, the dictionary:

```
{'project': {
  'namespace': {
    'module.py': ('print("Hello World!")',
                  helpers.NO_OVERWRITE)}}}
```

represents a `project/namespace/module.py` file with content `print("Hello World!")`, that will be created only if not present.

**Returns** resulting merged directory representation

**Return type** `dict`

---

**Note:** Use an empty string as content to ensure a file is created empty.

---

`pyscaffold.api.helpers.register` (*actions*, *action*, *before=None*, *after=None*)

Register a new action to be performed during scaffold.

### Parameters

- **actions** (*list*) – previous action list.
- **action** (*callable*) – function with two arguments: the first one is a (nested) dict representing the file structure of the project and the second is a dict with scaffold options. This function **MUST** return a tuple with two elements similar to its arguments. Example:

```
def do_nothing(struct, opts):
    return (struct, opts)
```

- **\*\*kwargs** (*dict*) – keyword arguments make it possible to choose a specific order when executing actions: when *before* or *after* keywords are provided, the argument value is used as a reference position for the new action. Example:

```
helpers.register(actions, do_nothing,
                 after='create_structure')
    # Look for the first action with a name
    # `create_structure` and inserts `do_nothing` after it.
    # If more than one registered action is named
    # `create_structure`, the first one is selected.

helpers.register(
    actions, do_nothing,
    before='pyscaffold.structure:create_structure')
    # Similar to the previous example, but the probability
    # of name conflict is decreased by including the module
    # name.
```

When no keyword argument is provided, the default execution order specifies that the action will be performed after the project structure is defined, but before it is written to the disk. Example:

```
helpers.register(actions, do_nothing)
    # The action will take place after
    # `pyscaffold.structure:define_structure`
```

**Returns** modified action list.

**Return type** *list*

`pyscaffold.api.helpers.reject` (*struct*, *path*)

Remove a file from the project tree representation if existent.

### Parameters

- **struct** (*dict*) – project representation as (possibly) nested *dict*. See *merge*.
- **path** (*str or list*) – file path relative to the structure root. The directory separator should be / (forward slash) if present. Alternatively, a list with the parts of the path can be provided, ordered from the structure root to the file itself. The following examples are equivalent:

```
'docs/api/index.html'
['docs', 'api', 'index.html']
```

**Returns** modified project tree representation

**Return type** `dict`

`pyscaffold.api.helpers.unregister` (*actions*, *reference*)  
Prevent a specific action to be executed during scaffold.

**Parameters**

- **actions** (*list*) – previous action list.
- **reference** (*str*) – action identifier. Similarly to the keyword arguments of `register` it can assume two formats:
  - the name of the function alone,
  - the name of the module followed by `:` and the name of the function

**Returns** modified action list.

**Return type** `list`

## Module contents

Exposed API for accessing PyScaffold via Python.

**class** `pyscaffold.api.Extension` (*name*)  
Bases: `object`

Base class for PyScaffold’s extensions

**activate** (*actions*)

Activates the extension by registering its functionality

**Parameters** **actions** (*list*) – list of action to perform

**Returns** updated list of actions

**Return type** `list`

**augment\_cli** (*parser*)

Augments the command-line interface parser

A command line argument `--FLAG` where `FLAG="self.name"` is added which appends `self.activate` to the list of extensions. As help text the docstring of the extension class is used. In most cases this method does not need to be overwritten.

**Parameters** **parser** – current parser object

**flag**

**mutually\_exclusive** = `False`

**static register** (*\*args*, *\*\*kwargs*)  
Shortcut for `helpers.register`

**static unregister** (*\*args*, *\*\*kwargs*)  
Shortcut for `helpers.unregister`

`pyscaffold.api.create_project` (*opts=None*, *\*\*kwargs*)  
Create the project’s directory structure

**Parameters**

- **opts** (*dict*) – options of the project
- **\*\*kwargs** – extra options, passed as keyword arguments

**Returns** list of actions

**Return type** `list`

Valid options include:

#### Naming

- **project** (*str*)
- **package** (*str*)

#### Package Information

- **author** (*str*)
- **email** (*str*)
- **release\_date** (*str*)
- **year** (*str*)
- **title** (*str*)
- **description** (*str*)
- **url** (*str*)
- **classifiers** (*str*)
- **requirements** (*list*)

#### PyScaffold Control

- **update** (*bool*)
- **force** (*bool*)
- **pretend** (*bool*)
- **extensions** (*list*)

Some of these options are equivalent to the command line options, others are used for creating the basic python package meta information, but the last tree can change the way PyScaffold behaves.

When the **force** flag is `True`, existing files will be overwritten. When the **update** flag is `True`, PyScaffold will consider that some files can be updated (usually the packaging boilerplate), but will keep others intact. When the **pretend** flag is `True`, the project will not be created/updated, but the expected outcome will be logged.

Finally, the **extensions** list may contain any function that follows the [extension API](#). Note that some PyScaffold features, such as travis, tox and pre-commit support, are implemented as built-in extensions. In order to use these features it is necessary to include the respective functions in the extension list. All built-in extensions are accessible via `pyscaffold.extensions` submodule.

Note that extensions may define extra options. For example, built-in cookiecutter extension define a `cookiecutter` option that should be the address to the git repository used as template.

`pyscaffold.api.discover_actions` (*extensions*)

Retrieve the action list.

This is done by concatenating the default list with the one generated after activating the extensions.

#### Parameters

- **extensions** (*list*) – list of functions responsible for activating the
- **extensions.** –

**Returns** scaffold actions.

**Return type** `list`

`pyscaffold.api.get_default_options(struct, opts)`

Compute all the options that can be automatically derived.

This function uses all the available information to generate sensible defaults. Several options that can be derived are computed when possible.

**Parameters**

- **struct** (*dict*) – project representation as (possibly) nested *dict*.
- **opts** (*dict*) – given options, see *create\_project* for an extensive list.

**Returns** project representation and options with default values set

**Return type** `dict, dict`

**Raises**

- *DirectoryDoesNotExist* – when PyScaffold is told to update a nonexistent directory
- *GitNotInstalled* – when git command is not available
- *GitNotConfigured* – when git does not know user information

---

**Note:** This function uses git to determine some options, such as author name and email.

---

`pyscaffold.api.init_git(struct, opts)`

Add revision control to the generated files.

**Parameters**

- **struct** (*dict*) – project representation as (possibly) nested *dict*.
- **opts** (*dict*) – given options, see *create\_project* for an extensive list.

**Returns** updated project representation and options

**Return type** `dict, dict`

`pyscaffold.api.verify_options_consistency(struct, opts)`

Perform some sanity checks about the given options.

**Parameters**

- **struct** (*dict*) – project representation as (possibly) nested *dict*.
- **opts** (*dict*) – given options, see *create\_project* for an extensive list.

**Returns** updated project representation and options

**Return type** `dict, dict`

## pyscaffold.contrib package

### Subpackages

## pyscaffold.contrib.setuptools\_scm package

### Submodules

## pyscaffold.contrib.setuptools\_scm.discover module

`pyscaffold.contrib.setuptools_scm.discover.iter_matching_entrypoints` (*path*,  
*entry-point*)

## pyscaffold.contrib.setuptools\_scm.git module

**class** `pyscaffold.contrib.setuptools_scm.git.GitWorkdir` (*path*)

Bases: `object`

experimental, may change at any time

**count\_all\_nodes** ()

**do\_ex** (*cmd*)

**fetch\_shallow** ()

**classmethod from\_potential\_worktree** (*wd*)

**is\_dirty** ()

**is\_shallow** ()

pyscaffold.contrib.setuptools\_scm.utils.**has\_command**(*name*)

pyscaffold.contrib.setuptools\_scm.utils.**trace**(\**k*)

### pyscaffold.contrib.setuptools\_scm.version module

**class** pyscaffold.contrib.setuptools\_scm.version.**ScmVersion**(*tag\_version*, *dis-*  
*tance=None*,  
*node=None*,  
*dirty=False*, *pre-*  
*formatted=False*,  
*\*\*kw*)

Bases: `object`

**exact**

**format\_choice**(*clean\_format*, *dirty\_format*)

**format\_with**(*fmt*)

pyscaffold.contrib.setuptools\_scm.version.**callable\_or\_entrypoint**(*group*,  
*callable\_or\_name*)

pyscaffold.contrib.setuptools\_scm.version.**format\_version**(*version*, *\*\*config*)

pyscaffold.contrib.setuptools\_scm.version.**get\_local\_dirty\_tag**(*version*)

pyscaffold.contrib.setuptools\_scm.version.**get\_local\_node\_and\_date**(*version*)

pyscaffold.contrib.setuptools\_scm.version.**guess\_next\_dev\_version**(*version*)

pyscaffold.contrib.setuptools\_scm.version.**guess\_next\_version**(*tag\_version*, *dis-*  
*tance*)

```
pyscaffold.contrib.setuptools_scm.version.meta (tag, distance=None, dirty=False,
                                                node=None, preformatted=False,
                                                **kw)
```

```
pyscaffold.contrib.setuptools_scm.version.postrelease_version (version)
```

```
pyscaffold.contrib.setuptools_scm.version.tag_to_version (tag)
```

```
pyscaffold.contrib.setuptools_scm.version.tags_to_versions (tags)
```

## Module contents

**copyright** 2010-2015 by Ronny Pfannschmidt

**license** MIT

```
pyscaffold.contrib.setuptools_scm.dump_version (root, version, write_to, template=None)
```

```
pyscaffold.contrib.setuptools_scm.get_version (root='.', version_scheme='guess-
                                                next-dev', local_scheme='node-
                                                and-date', write_to=None,
                                                write_to_template=None, rela-
                                                tive_to=None, parse=None)
```

If supplied, `relative_to` should be a file from which `root` may be resolved. Typically called by a script or module that is not in the root of the repository to direct `setuptools_scm` to the root of the repository by supplying `__file__`.

```
pyscaffold.contrib.setuptools_scm.version_from_scm (root)
```

## Submodules

### pyscaffold.contrib.ptr module

Copyright Jason R. Coombs

MIT-licenced

Implementation

```
class pyscaffold.contrib.ptr.CustomizedDist (attrs=None)
```

```
    Bases: setuptools.dist.Distribution
```

```
    allow_hosts = None
```

```
    fetch_build_egg (req)
```

Specialized version of `Distribution.fetch_build_egg` that respects respects `allow_hosts` and `index_url`.

```
    index_url = None
```

```
class pyscaffold.contrib.ptr.PyTest (dist, **kw)
```

```
    Bases: setuptools.command.test.test
```

```
>>> import setuptools
>>> dist = setuptools.Distribution()
>>> cmd = PyTest(dist)
```

```
    finalize_options ()
```

```
    initialize_options ()
```

**install\_dists** (*dist*)

Extend install\_dists to include extras support

**install\_extra\_dists** (*dist*)

Install extras that are indicated by markers or install all extras if ‘-extras’ is indicated.

**static marker\_passes** (*marker*)

Given an environment marker, return True if the marker is valid and matches this environment.

**static paths\_on\_pythonpath** (*paths*)

Backward compatibility for paths\_on\_pythonpath; Returns a null context if paths\_on\_pythonpath is not implemented in orig.test. Note that this also means that the paths iterable is never consumed, which incidentally means that the None values from dist.fetch\_build\_eggs in older Setuptools will be disregarded.

**run** ()

Override run to ensure requirements are available in this session (but don’t install them anywhere).

**run\_tests** ()

Invoke pytest, replacing argv.

**user\_options** = [('extras', None, 'Install (all) setuptools extras when running tests')]

pyscaffold.contrib.ptr.null()

## pyscaffold.contrib.six module

Utilities for writing code that runs on Python 2 and 3

**class** pyscaffold.contrib.six.**Module\_six\_moves\_urllib**

Bases: module

Create a six.moves.urllib namespace that resembles the Python 3 namespace

**error** = <module 'pyscaffold.contrib.six.moves.urllib.error'>

**parse** = <module 'pyscaffold.contrib.six.moves.urllib.parse'>

**request** = <module 'pyscaffold.contrib.six.moves.urllib.request'>

**response** = <module 'pyscaffold.contrib.six.moves.urllib.response'>

**robotparser** = <module 'pyscaffold.contrib.six.moves.urllib.robotparser'>

**class** pyscaffold.contrib.six.**Module\_six\_moves\_urllib\_error** (*name*)

Bases: pyscaffold.contrib.six.\_LazyModule

Lazy loading of moved objects in six.moves.urllib\_error

**ContentTooShortError**

**HTTPError**

**URLError**

**class** pyscaffold.contrib.six.**Module\_six\_moves\_urllib\_parse** (*name*)

Bases: pyscaffold.contrib.six.\_LazyModule

Lazy loading of moved objects in six.moves.urllib\_parse

**ParseResult**

**SplitResult**

**parse\_qs**

`parse_qs1`  
`quote`  
`quote_plus`  
`splitquery`  
`splittag`  
`splituser`  
`splitvalue`  
`unquote`  
`unquote_plus`  
`unquote_to_bytes`  
`urldefrag`  
`urlencode`  
`urljoin`  
`urlparse`  
`urlsplit`  
`urlunparse`  
`urlunsplit`  
`uses_fragment`  
`uses_netloc`  
`uses_params`  
`uses_query`  
`uses_relative`

**class** `pyscaffold.contrib.six.Module_six_moves_urllib_request` (*name*)

Bases: `pyscaffold.contrib.six._LazyModule`

Lazy loading of moved objects in `six.moves.urllib_request`

**AbstractBasicAuthHandler**

**AbstractDigestAuthHandler**

**BaseHandler**

**CacheFTPHandler**

**FTPHandler**

**FancyURLopener**

**FileHandler**

**HTTPBasicAuthHandler**

**HTTPCookieProcessor**

**HTTPDefaultErrorHandler**

**HTTPDigestAuthHandler**

**HTTPErrorProcessor**  
**HTTPHandler**  
**HTTPPasswordMgr**  
**HTTPPasswordMgrWithDefaultRealm**  
**HTTPRedirectHandler**  
**HTTPSHandler**  
**OpenerDirector**  
**ProxyBasicAuthHandler**  
**ProxyDigestAuthHandler**  
**ProxyHandler**  
**Request**  
**URLopener**  
**UnknownHandler**  
**build\_opener**  
**getproxies**  
**install\_opener**  
**parse\_http\_list**  
**parse\_keqv\_list**  
**pathname2url**  
**proxy\_bypass**  
**url2pathname**  
**urlcleanup**  
**urlopen**  
**urlretrieve**

**class** pyscaffold.contrib.six.**Module\_six\_moves\_urllib\_response** (*name*)

Bases: pyscaffold.contrib.six.\_LazyModule

Lazy loading of moved objects in six.moves.urllib\_response

**addbase**

**addclosehook**

**addinfo**

**addinfourl**

**class** pyscaffold.contrib.six.**Module\_six\_moves\_urllib\_robotparser** (*name*)

Bases: pyscaffold.contrib.six.\_LazyModule

Lazy loading of moved objects in six.moves.urllib\_robotparser

**RobotFileParser**

**class** pyscaffold.contrib.six.**MovedAttribute** (*name, old\_mod, new\_mod, old\_attr=None, new\_attr=None*)

Bases: pyscaffold.contrib.six.\_LazyDescr

---

**class** pyscaffold.contrib.six.**MovedModule** (*name, old, new=None*)  
 Bases: pyscaffold.contrib.six.\_LazyDescr

pyscaffold.contrib.six.**add\_metaclass** (*metaclass*)  
 Class decorator for creating a class with a metaclass.

pyscaffold.contrib.six.**add\_move** (*move*)  
 Add an item to six.moves.

pyscaffold.contrib.six.**assertCountEqual** (*self, \*args, \*\*kwargs*)

pyscaffold.contrib.six.**assertRaisesRegex** (*self, \*args, \*\*kwargs*)

pyscaffold.contrib.six.**assertRegex** (*self, \*args, \*\*kwargs*)

pyscaffold.contrib.six.**b** (*s*)  
 Byte literal

pyscaffold.contrib.six.**create\_unbound\_method** (*func, cls*)

pyscaffold.contrib.six.**get\_unbound\_function** (*unbound*)  
 Get the function out of a possibly unbound function

pyscaffold.contrib.six.**int2byte** ()  
 S.pack(v1, v2, ...) -> bytes  
 Return a bytes object containing values v1, v2, ... packed according to the format string S.format. See help(struct) for more on format strings.

pyscaffold.contrib.six.**iteritems** (*d, \*\*kw*)  
 Return an iterator over the (key, value) pairs of a dictionary.

pyscaffold.contrib.six.**iterkeys** (*d, \*\*kw*)  
 Return an iterator over the keys of a dictionary.

pyscaffold.contrib.six.**iterlists** (*d, \*\*kw*)  
 Return an iterator over the (key, [values]) pairs of a dictionary.

pyscaffold.contrib.six.**itervalues** (*d, \*\*kw*)  
 Return an iterator over the values of a dictionary.

pyscaffold.contrib.six.**python\_2\_unicode\_compatible** (*klass*)  
 A decorator that defines `__unicode__` and `__str__` methods under Python 2. Under Python 3 it does nothing.  
 To support Python 2 and 3 with a single code base, define a `__str__` method returning text and apply this decorator to the class.

pyscaffold.contrib.six.**raise\_from** (*value, from\_value*)

pyscaffold.contrib.six.**remove\_move** (*name*)  
 Remove item from six.moves.

pyscaffold.contrib.six.**reraise** (*tp, value, tb=None*)  
 Reraise an exception.

pyscaffold.contrib.six.**u** (*s*)  
 Text literal

pyscaffold.contrib.six.**with\_metaclass** (*meta, \*bases*)  
 Create a base class with a metaclass.

### Module contents

Contribution packages used by PyScaffold

All packages inside `contrib` are external packages that come with their own licences and are not part of the PyScaffold source code itself. The reason for shipping these dependencies directly is to avoid problems in the resolution of `setup_requires` dependencies that occurred more often than not, see issues #71 and #72.

Currently the `contrib` packages are:

1. `setuptools_scm` v1.15.6
2. `six` 1.11.0
3. `pytest-runner` 3.0

The packages/modules were just copied over.

```
pyscaffold.contrib.scm.find_files(*args, **kwargs)
pyscaffold.contrib.scm.get_local_dirty_tag(*args, **kwargs)
pyscaffold.contrib.scm.get_local_node_and_date(*args, **kwargs)
pyscaffold.contrib.scm.guess_next_dev_version(*args, **kwargs)
pyscaffold.contrib.scm.parse_archival(*args, **kwargs)
pyscaffold.contrib.scm.parse_git(*args, **kwargs)
pyscaffold.contrib.scm.parse_hg(*args, **kwargs)
pyscaffold.contrib.scm.parse_pkginfo(*args, **kwargs)
pyscaffold.contrib.scm.postrelease_version(*args, **kwargs)
pyscaffold.contrib.warn_about_deprecated_pyscaffold()
pyscaffold.contrib.write_pbr_json(*args, **kwargs)
```

### pyscaffold.extensions package

#### Submodules

#### pyscaffold.extensions.cookiecutter module

Extension that integrates cookiecutter templates into PyScaffold.

```
class pyscaffold.extensions.cookiecutter.Cookiecutter(name)
```

Bases: `pyscaffold.api.Extension`

Additionally apply a Cookiecutter template

```
activate (actions)
```

Register `before_create` hooks to generate project using Cookiecutter

**Parameters** `actions` (*list*) – list of actions to perform

**Returns** updated list of actions

**Return type** `list`

```
augment_cli (parser)
```

Add an option to parser that enables the Cookiecutter extension

Parameters `parser` (`argparse.ArgumentParser`) – CLI parser object

`mutually_exclusive = True`

**exception** `pyscaffold.extensions.cookiecutter.MissingTemplate` (`message='missing 'cookiecutter' option', *args, **kwargs`)

Bases: `RuntimeError`

A cookiecutter template (git url) is required.

`DEFAULT_MESSAGE = 'missing `cookiecutter` option'`

**exception** `pyscaffold.extensions.cookiecutter.NotInstalled` (`message='cookiecutter is not installed, run: pip install cookiecutter', *args, **kwargs`)

Bases: `RuntimeError`

This extension depends on the `cookiecutter` package.

`DEFAULT_MESSAGE = 'cookiecutter is not installed, run: pip install cookiecutter'`

`pyscaffold.extensions.cookiecutter.create_cookiecutter` (`struct, opts`)

Create a cookie cutter template

#### Parameters

- `struct` (`dict`) – project representation as (possibly) nested `dict`.
- `opts` (`dict`) – given options, see `create_project` for an extensive list.

**Returns** updated project representation and options

**Return type** `struct, opts`

`pyscaffold.extensions.cookiecutter.create_cookiecutter_parser` (`obj_ref`)

Create a Cookiecutter parser.

**Parameters** `obj_ref` (`Extension`) – object reference to the actual extension

**Returns** parser for namespace cli argument

**Return type** `NamespaceParser`

`pyscaffold.extensions.cookiecutter.enforce_cookiecutter_options` (`struct, opts`)

Make sure options reflect the cookiecutter usage.

#### Parameters

- `struct` (`dict`) – project representation as (possibly) nested `dict`.
- `opts` (`dict`) – given options, see `create_project` for an extensive list.

**Returns** updated project representation and options

**Return type** `struct, opts`

## `pyscaffold.extensions.django` module

Extension that creates a base structure for the project using `django-admin.py`.

**class** pyscaffold.extensions.django.Django(*name*)

Bases: *pyscaffold.api.Extension*

Generate Django project files

**activate** (*actions*)

Register hooks to generate project using django-admin.

**Parameters** *actions* (*list*) – list of actions to perform

**Returns** updated list of actions

**Return type** *list*

**mutually\_exclusive** = True

**exception** pyscaffold.extensions.django.DjangoAdminNotInstalled(*message='django-admin.py is not installed, run: pip install django', \*args, \*\*kwargs*)

Bases: *RuntimeError*

This extension depends on the `django-admin.py` cli script.

**DEFAULT\_MESSAGE** = 'django-admin.py is not installed, run: pip install django'

pyscaffold.extensions.django.create\_django\_proj(*struct, opts*)

Creates a standard Django project with `django-admin.py`

**Parameters**

- **struct** (*dict*) – project representation as (possibly) nested *dict*.
- **opts** (*dict*) – given options, see `create_project` for an extensive list.

**Returns** updated project representation and options

**Return type** *struct, opts*

**Raises** *RuntimeError* – raised if `django-admin.py` is not installed

pyscaffold.extensions.django.enforce\_django\_options(*struct, opts*)

Make sure options reflect the Django usage.

**Parameters**

- **struct** (*dict*) – project representation as (possibly) nested *dict*.
- **opts** (*dict*) – given options, see `create_project` for an extensive list.

**Returns** updated project representation and options

**Return type** *struct, opts*

## pyscaffold.extensions.gitlab\_ci module

Extension that generates configuration and script files for GitLab CI.

**class** pyscaffold.extensions.gitlab\_ci.GitLab(*name*)

Bases: *pyscaffold.api.Extension*

Generate GitLab CI configuration files

**activate** (*actions*)  
Activate extension

**Parameters** **actions** (*list*) – list of actions to perform

**Returns** updated list of actions

**Return type** *list*

**add\_files** (*struct, opts*)  
Add .gitlab-ci.yml file to structure

**Parameters**

- **struct** (*dict*) – project representation as (possibly) nested *dict*.
- **opts** (*dict*) – given options, see `create_project` for an extensive list.

**Returns** updated project representation and options

**Return type** *struct, opts*

### pyscaffold.extensions.namespace module

Extension that adjust project file tree to include a namespace package.

This extension adds a **namespace** option to `create_project` and provides correct values for the options **root\_pkg** and **namespace\_pkg** to the following functions in the action list.

**class** `pyscaffold.extensions.namespace.Namespace` (*name*)  
Bases: `pyscaffold.api.Extension`

Omit creation of skeleton.py

**activate** (*actions*)  
Register an action responsible for adding namespace to the package.

**Parameters** **actions** (*list*) – list of actions to perform

**Returns** updated list of actions

**Return type** *list*

**augment\_cli** (*parser*)  
Add an option to parser that enables the namespace extension.

**Parameters** **parser** (`argparse.ArgumentParser`) – CLI parser object

`pyscaffold.extensions.namespace.add_namespace` (*struct, opts*)  
Prepend the namespace to a given file structure

**Parameters**

- **struct** (*dict*) – directory structure as dictionary of dictionaries
- **opts** (*dict*) – options of the project

**Returns** directory structure as dictionary of dictionaries and input options

**Return type** `tuple(dict, dict)`

`pyscaffold.extensions.namespace.create_namespace_parser` (*obj\_ref*)  
Create a namespace parser.

**Parameters** **obj\_ref** (`Extension`) – object reference to the actual extension

**Returns** parser for namespace cli argument

**Return type** NamespaceParser

`pyscaffold.extensions.namespace.enforce_namespace_options` (*struct, opts*)

Make sure options reflect the namespace usage.

`pyscaffold.extensions.namespace.move_old_package` (*struct, opts*)

Move old package that may be eventually created without namespace

**Parameters**

- **struct** (*dict*) – directory structure as dictionary of dictionaries
- **opts** (*dict*) – options of the project

**Returns** directory structure as dictionary of dictionaries and input options

**Return type** tuple(dict, dict)

### `pyscaffold.extensions.no_skeleton` module

Extension that omits the creation of file `skeleton.py`

**class** `pyscaffold.extensions.no_skeleton.NoSkeleton` (*name*)

Bases: `pyscaffold.api.Extension`

Omit creation of `skeleton.py` and `test_skeleton.py`

**activate** (*actions*)

Activate extension

**Parameters** **actions** (*list*) – list of actions to perform

**Returns** updated list of actions

**Return type** list

**remove\_files** (*struct, opts*)

Remove all skeleton files from structure

**Parameters**

- **struct** (*dict*) – project representation as (possibly) nested `dict`.
- **opts** (*dict*) – given options, see `create_project` for an extensive list.

**Returns** updated project representation and options

**Return type** struct, opts

### `pyscaffold.extensions.pre_commit` module

Extension that generates configuration files for Yelp `pre-commit`.

**class** `pyscaffold.extensions.pre_commit.PreCommit` (*name*)

Bases: `pyscaffold.api.Extension`

Generate pre-commit configuration file

**activate** (*actions*)

Activate extension

**Parameters** **actions** (*list*) – list of actions to perform

**Returns** updated list of actions

**Return type** `list`

**add\_files** (*struct, opts*)

Add `.pre-commit-config.yaml` file to structure

**Parameters**

- **struct** (*dict*) – project representation as (possibly) nested `dict`.
- **opts** (*dict*) – given options, see `create_project` for an extensive list.

**Returns** updated project representation and options

**Return type** `struct, opts`

### **pyscaffold.extensions.tox module**

Extension that generates configuration files for the Tox test automation tool.

**class** `pyscaffold.extensions.tox.Tox` (*name*)

Bases: `pyscaffold.api.Extension`

Generate Tox configuration file

**activate** (*actions*)

Activate extension

**Parameters** **actions** (*list*) – list of actions to perform

**Returns** updated list of actions

**Return type** `list`

**add\_files** (*struct, opts*)

Add `.tox.ini` file to structure

**Parameters**

- **struct** (*dict*) – project representation as (possibly) nested `dict`.
- **opts** (*dict*) – given options, see `create_project` for an extensive list.

**Returns** updated project representation and options

**Return type** `struct, opts`

### **pyscaffold.extensions.travis module**

Extension that generates configuration and script files for Travis CI.

**class** `pyscaffold.extensions.travis.Travis` (*name*)

Bases: `pyscaffold.api.Extension`

Generate Travis CI configuration files

**activate** (*actions*)

Activate extension

**Parameters** **actions** (*list*) – list of actions to perform

**Returns** updated list of actions

**Return type** `list`

**add\_files** (*struct*, *opts*)

Add some Travis files to structure

**Parameters**

- **struct** (*dict*) – project representation as (possibly) nested `dict`.
- **opts** (*dict*) – given options, see `create_project` for an extensive list.

**Returns** updated project representation and options

**Return type** `struct`, `opts`

## Module contents

Built-in extensions for PyScaffold.

## `pyscaffold.templates` package

### Module contents

Templates for all files of a project's scaffold

`pyscaffold.templates.authors` (*opts*)

Template of AUTHORS.rst

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.changelog` (*opts*)

Template of CHANGELOG.rst

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.conftest_py` (*opts*)

Template of conftest.py

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.coveragerc` (*opts*)

Template of .coveragerc

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.get_template` (*name*)

Retrieve the template by name

**Parameters** `name` – name of template

**Returns** template

**Return type** `string.Template`

`pyscaffold.templates.gitignore` (*opts*)

Template of .gitignore

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.gitignore_empty` (*opts*)

Template of empty .gitignore

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.gitlab_ci` (*opts*)

Template of .gitlab-ci.yml

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.init` (*opts*)

Template of \_\_init\_\_.py

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.license` (*opts*)

Template of LICENSE.txt

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.namespace` (*opts*)

Template of \_\_init\_\_.py defining a namespace package

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.pre_commit_config` (*opts*)

Template of .pre-commit-config.yaml

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.readme` (*opts*)

Template of README.rst

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.requirements` (*opts*)

Template of requirements.txt

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.setup_cfg` (*opts*)

Template of setup.cfg

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.setup_py` (*opts*)

Template of setup.py

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.skeleton` (*opts*)

Template of skeleton.py defining a basic console script

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.sphinx_authors` (*opts*)

Template of authors.rst

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.sphinx_changelog` (*opts*)

Template of changelog.rst

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.sphinx_conf` (*opts*)

Template of conf.py

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.sphinx_index` (*opts*)  
Template of index.rst

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.sphinx_license` (*opts*)  
Template of license.rst

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.sphinx_makefile` (*opts*)  
Template of Sphinx's Makefile

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.test_skeleton` (*opts*)  
Template of unittest for skeleton.py

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.tox` (*opts*)  
Template of tox.ini

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.travis` (*opts*)  
Template of .travis.yml

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

`pyscaffold.templates.travis_install` (*opts*)  
Template of travis\_install.sh

**Parameters** `opts` – mapping parameters as dictionary

**Returns** file content as string

**Return type** `str`

## 12.1.2 Submodules

### 12.1.3 pyscaffold.cli module

Command-Line-Interface of PyScaffold

`pyscaffold.cli.add_default_args(parser)`

Add the default options and arguments to the CLI parser.

**Parameters** `parser` (`argparse.ArgumentParser`) – CLI parser object

`pyscaffold.cli.list_actions(opts)`

Do not create a project, just list actions considering extensions

**Parameters** `opts` (`dict`) – command line options as dictionary

`pyscaffold.cli.main(args)`

Main entry point for external applications

**Parameters** `args` (`[str]`) – command line arguments

`pyscaffold.cli.parse_args(args)`

Parse command line parameters

**Parameters** `args` (`[str]`) – command line parameters as list of strings

**Returns** command line parameters

**Return type** `dict`

`pyscaffold.cli.run()`

Entry point for console script

`pyscaffold.cli.run_scaffold(opts)`

Actually scaffold the project, calling the python API

**Parameters** `opts` (`dict`) – command line options as dictionary

### 12.1.4 pyscaffold.exceptions module

Custom exceptions used by PyScaffold to identify common deviations from the expected behavior.

**exception** `pyscaffold.exceptions.ActionNotFound(name, *args, **kwargs)`

Bases: `KeyError`

Impossible to find the required action.

**exception** `pyscaffold.exceptions.DirectoryAlreadyExists`

Bases: `RuntimeError`

The project directory already exists, but no `update` or `force` option was used.

**exception** `pyscaffold.exceptions.DirectoryDoesNotExist`

Bases: `RuntimeError`

No directory was found to be updated.

**exception** `pyscaffold.exceptions.GitNotConfigured` (*message='Make sure git is configured. Run:\n git config --global user.email "you@example.com"\n git config --global user.name "Your Name"\n to set your account's default identity.'*, \*args, \*\*kwargs)

Bases: `RuntimeError`

PyScaffold tries to read user.name and user.email from git config.

**DEFAULT\_MESSAGE** = 'Make sure git is configured. Run:\n git config --global user.email

**exception** `pyscaffold.exceptions.GitNotInstalled` (*message='Make sure git is installed and working.'*, \*args, \*\*kwargs)

Bases: `RuntimeError`

PyScaffold requires git to run.

**DEFAULT\_MESSAGE** = 'Make sure git is installed and working.'

**exception** `pyscaffold.exceptions.InvalidIdentifier`

Bases: `RuntimeError`

Python requires a specific format for its identifiers.

[https://docs.python.org/3.6/reference/lexical\\_analysis.html#identifiers](https://docs.python.org/3.6/reference/lexical_analysis.html#identifiers)

**exception** `pyscaffold.exceptions.NoPyScaffoldProject` (*message='Could not update project. Was it generated with PyScaffold?'*, \*args, \*\*kwargs)

Bases: `RuntimeError`

PyScaffold cannot update a project that it hasn't generated

**DEFAULT\_MESSAGE** = 'Could not update project. Was it generated with PyScaffold?'

**exception** `pyscaffold.exceptions.OldSetuptools` (*message='Your setuptools version is too old (<30.3.0). Use 'pip install -U setuptools' to upgrade.If you have the deprecated 'distribute' package installed remove it or update to version 0.7.3.'*, \*args, \*\*kwargs)

Bases: `RuntimeError`

PyScaffold requires a recent version of setuptools (>= 12).

**DEFAULT\_MESSAGE** = 'Your setuptools version is too old (<30.3.0). Use `pip install -U s

**exception** `pyscaffold.exceptions.PyScaffoldTooOld` (*message='setup.cfg has no section [pyscaffold]! Are you trying to update a pre 3.0 version?'*, \*args, \*\*kwargs)

Bases: `RuntimeError`

PyScaffold cannot update a pre 3.0 version

**DEFAULT\_MESSAGE** = 'setup.cfg has no section [pyscaffold]! Are you trying to update a p

**exception** `pyscaffold.exceptions.ShellCommandException` (*message, \*args, \*\*kwargs*)

Bases: `RuntimeError`

Outputs proper logging when a ShellCommand fails

### 12.1.5 pyscaffold.info module

Provide general information about the system, user etc.

`pyscaffold.info.check_git()`

Checks for git and raises appropriate exception if not

**Raises**

- *GitNotInstalled* – when git command is not available
- *GitNotConfigured* – when git does not know user information

`pyscaffold.info.email()`

Retrieve the user's email

**Returns** user's email

**Return type** `str`

`pyscaffold.info.is_git_configured()`

Check if `user.name` and `user.email` is set globally in git

This will also return false if git is not available at all.

**Returns** True if it is set globally, False otherwise

**Return type** `bool`

`pyscaffold.info.is_git_installed()`

Check if git is installed

**Returns** True if git is installed, False otherwise

**Return type** `bool`

`pyscaffold.info.project(opts)`

Update user options with the options of an existing PyScaffold project

**Params:** `opts` (dict): options of the project

**Returns** options with updated values

**Return type** `dict`

**Raises**

- *PyScaffoldTooOld* – when PyScaffold is too old to update from
- *NoPyScaffoldProject* – when project was not generated with PyScaffold

`pyscaffold.info.username()`

Retrieve the user's name

**Returns** user's name

**Return type** `str`

### 12.1.6 pyscaffold.integration module

Integration part for hooking into distutils/setuptools

Rationale: The `use_pyscaffold` keyword is unknown to setuptools' `setup(...)` command, therefore the `entry_points` are checked for a function to handle this keyword which is `pyscaffold_keyword` below. This is where we hook into setuptools and apply the magic of `setuptools_scm` as well as other commands..

**class** `pyscaffold.integration.PyTest` (*dist*, *\*\*kw*)

Bases: `pyscaffold.contrib.ptr.PyTest`

**run\_tests** ()

`pyscaffold.integration.build_cmd_docs` ()

Return Sphinx's BuildDoc if available otherwise a dummy command

**Returns** command object

**Return type** `Command`

`pyscaffold.integration.local_version2str` (*version*)

Create the local part of a PEP440 version string

**Parameters** **version** (`setuptools_scm.version.ScmVersion`) – version object

**Returns** local version

**Return type** `str`

`pyscaffold.integration.pyscaffold_keyword` (*dist*, *keyword*, *value*)

Handles the `use_pyscaffold` keyword of the `setup(...)` command

**Parameters**

- **dist** (`setuptools.dist`) – distribution object as
- **keyword** (`str`) – keyword argument = 'use\_pyscaffold'
- **value** – value of the keyword argument

`pyscaffold.integration.version2str` (*version*)

Creates a PEP440 version string

**Parameters** **version** (`setuptools_scm.version.ScmVersion`) – version object

**Returns** version string

**Return type** `str`

## 12.1.7 pyscaffold.log module

Custom logging infrastructure to provide execution information for the user.

**class** `pyscaffold.log.ColoredReportFormatter` (*fmt=None*, *datefmt=None*, *style='%'*)

Bases: `pyscaffold.log.ReportFormatter`

Format logs with ANSI colors.

**ACTIVITY\_STYLES** = `defaultdict` (<function `ColoredReportFormatter.<lambda>`>, {'remove':

**CONTEXT\_PREFIX** = `'\x1b[35m\x1b[1mfrom\x1b[0m'`

**LOG\_STYLES** = `defaultdict` (<class `'tuple'`>, {'warning': ('yellow',), 'info': ('blue',)

**SUBJECT\_STYLES** = `defaultdict` (<class `'tuple'`>, {'invoke': ('blue',)})

**TARGET\_PREFIX** = `'\x1b[35m\x1b[1mto\x1b[0m'`

**format\_activity** (*activity*)

**format\_default** (*record*)

**format\_subject** (*subject*, *activity=None*)

```
class pyscaffold.log.ReportFormatter (fmt=None, datefmt=None, style='%')
```

```
    Bases: logging.Formatter
```

Formatter that understands custom fields in the log record.

```
ACTIVITY_MAXLEN = 12
```

```
CONTEXT_PREFIX = 'from'
```

```
SPACING = ' '
```

```
TARGET_PREFIX = 'to'
```

```
create_padding (activity)
```

Create the appropriate padding in order to align activities.

```
format (record)
```

Compose message when a record with report information is given.

```
format_activity (activity)
```

Format the activity keyword.

```
format_context (context, _activity=None)
```

Format extra information about the activity context.

```
format_default (record)
```

Format default log messages.

```
format_path (path)
```

Simplify paths to avoid wasting space in terminal.

```
format_report (record)
```

Compose message when a custom record is given.

```
format_subject (subject, _activity=None)
```

Format the subject of the activity.

```
format_target (target, _activity=None)
```

Format extra information about the activity target.

```
class pyscaffold.log.ReportLogger (logger=None, handler=None, formatter=None, extra=None)
```

```
    Bases: logging.LoggerAdapter
```

Suitable wrapper for PyScaffold CLI interactive execution reports.

#### Parameters

- **logger** (*logging.Logger*) – custom logger to be used. Optional: the default logger will be used.
- **handlers** (*logging.Handler*) – custom logging handler to be used. Optional: a *logging.StreamHandler* is used by default.
- **formatter** (*logging.Formatter*) – custom formatter to be used. Optional: by default a *ReportFormatter* is created and used.
- **extra** (*dict*) – extra attributes to be merged into the log record. Options, empty by default.

#### wrapped

*logging.Logger* – underlying logger object.

#### handler

*logging.Handler* – stream handler configured for providing user feedback in PyScaffold CLI.

**formatter**

*logging.Formatter* – formatter configured in the default handler.

**nesting**

*int* – current nesting level of the report.

**copy()**

Produce a copy of the wrapped logger.

Sometimes, it is better to make a copy of the report logger to keep indentation consistent.

**indent (count=1)**

Temporarily adjust padding while executing a context.

**Example**

```
from pyscaffold.log import logger
logger.report('invoke', 'custom_action')
with logger.indent():
    logger.report('create', 'some/file/path')

# Expected logs:
# -----
#      invoke  custom_action
#      create   some/file/path
# -----
# Note how the spacing between activity and subject in the
# second entry is greater than the equivalent in the first one.
```

**process (msg, kwargs)**

Method overridden to augment LogRecord with the *nesting* attribute.

**report (activity, subject, context=None, target=None, nesting=None, level=20)**

Log that an activity has occurred during scaffold.

**Parameters**

- **activity** (*str*) – usually a verb or command, e.g. `create`, `invoke`, `run`, `chdir`...
- **subject** (*str*) – usually a path in the file system or an action identifier.
- **context** (*str*) – path where the activity take place.
- **target** (*str*) – path affected by the activity
- **nesting** (*int*) – optional nesting level. By default it is calculated from the activity name.
- **level** (*int*) – log level. Defaults to `logging.INFO`. See `logging` for more information.

**Notes**

This method creates a custom log record, with additional fields: **activity**, **subject**, **context**, **target** and **nesting**, but an empty **msg** field. The *ReportFormatter* creates the log message from the other fields.

Often **target** and **context** complement the logs when **subject** does not hold all the necessary information. For example:

```
logger.report('copy', 'my/file', target='my/awesome/path')
logger.report('run', 'command', context='current/working/dir')
```

`pyscaffold.log.configure_logger` (*opts*)  
Configure the default logger

**Parameters** `opts` (*dict*) – command line parameters

`pyscaffold.log.logger` = `<pyscaffold.log.ReportLogger object>`  
Default logger configured for PyScaffold.

## 12.1.8 pyscaffold.repo module

Functionality for working with a git repository

`pyscaffold.repo.add_tag` (*project, tag\_name, message=None, \*\*kwargs*)  
Add an (annotated) tag to the git repository.

### Parameters

- **project** (*str*) – path to the project
- **tag\_name** (*str*) – name of the tag
- **message** (*str*) – optional tag message

Additional keyword arguments are passed to the *git* callable object.

`pyscaffold.repo.get_git_root` (*default=None*)  
Return the path to the top-level of the git repository or *default*.

**Parameters** `default` (*str*) – if no git root is found, default is returned

**Returns** top-level path or *default*

**Return type** *str*

`pyscaffold.repo.git_tree_add` (*struct, prefix="", \*\*kwargs*)  
Adds recursively a directory structure to git

### Parameters

- **struct** (*dict*) – directory structure as dictionary of dictionaries
- **prefix** (*str*) – prefix for the given directory structure

Additional keyword arguments are passed to the *git* callable object.

`pyscaffold.repo.init_commit_repo` (*project, struct, \*\*kwargs*)  
Initialize a git repository

### Parameters

- **project** (*str*) – path to the project
- **struct** (*dict*) – directory structure as dictionary of dictionaries

Additional keyword arguments are passed to the *git* callable object.

`pyscaffold.repo.is_git_repo` (*folder*)  
Check if a folder is a git repository

**Parameters** `folder` (*str*) – path

## 12.1.9 pyscaffold.shell module

Shell commands like git, django-admin.py etc.

**class** `pyscaffold.shell.ShellCommand` (*command*, *shell=True*, *cwd=None*)  
 Bases: `object`

Shell command that can be called with flags like git('add', 'file')

### Parameters

- **command** (*str*) – command to handle
- **shell** (*bool*) – run the command in the shell
- **cwd** (*str*) – current working dir to run the command

The produced command can be called with the following keyword arguments:

- **log** (*bool*): log activity when true. `False` by default.
- **pretend** (*bool*): skip execution (but log) when pretending. `False` by default.

The positional arguments are passed to the underlying shell command.

`pyscaffold.shell.command_exists` (*cmd*)  
 Check if command exists

**Parameters** *cmd* – executable name

`pyscaffold.shell.django_admin` = `<pyscaffold.shell.ShellCommand object>`  
 Command for django-admin.py

`pyscaffold.shell.get_git_cmd` (*\*\*args*)  
 Retrieve the git shell command depending on the current platform

**Parameters** *\*\*args* – additional keyword arguments to `ShellCommand`

`pyscaffold.shell.git` = `<pyscaffold.shell.ShellCommand object>`  
 Command for git

`pyscaffold.shell.shell_command_error2exit_decorator` (*func*)  
 Decorator to convert given ShellCommandException to an exit message

This avoids displaying nasty stack traces to end-users

## 12.1.10 pyscaffold.structure module

Functionality to generate and work with the directory structure of a project

**class** `pyscaffold.structure.FileOp`  
 Bases: `object`

Namespace for file operations during an update

**NO\_CREATE** = 1  
 Do not create the file during an update

**NO\_OVERWRITE** = 0  
 Do not overwrite an existing file during update (still created if not exists)

`pyscaffold.structure.apply_update_rule_to_file` (*path*, *value*, *opts*)  
 Applies the update rule to a given file path

### Parameters

- **path** (*str*) – file path
- **value** (*tuple or str*) – content (and update rule)
- **opts** (*dict*) – options of the project, containing the following flags:
  - **update**: when the project already exists and should be updated
  - **force**: overwrite all the files that already exist

**Returns** content of the file if it should be generated or None otherwise.

`pyscaffold.structure.apply_update_rules` (*struct, opts, prefix=None*)

Apply update rules using *FileOp* to a directory structure.

As a result the filtered structure keeps only the files that actually will be written.

**Parameters**

- **opts** (*dict*) – options of the project, containing the following flags:
  - **update**: when the project already exists and should be updated
  - **force**: overwrite all the files that already exist
- **struct** (*dict*) – directory structure as dictionary of dictionaries (in this tree representation, each leaf can be just a string or a tuple also containing an update rule)
- **prefix** (*str*) – prefix path for the structure

**Returns** directory structure with keys removed according to the rules (in this tree representation, all the leaves are strings) and input options

**Return type** `tuple(dict, dict)`

`pyscaffold.structure.create_structure` (*struct, opts, prefix=None*)

Manifests a directory structure in the filesystem

**Parameters**

- **struct** (*dict*) – directory structure as dictionary of dictionaries
- **opts** (*dict*) – options of the project
- **prefix** (*str*) – prefix path for the structure

**Returns** directory structure as dictionary of dictionaries (similar to input, but only containing the files that actually changed) and input options

**Return type** `tuple(dict, dict)`

**Raises** `RuntimeError` – raised if content type in struct is unknown

`pyscaffold.structure.define_structure` (*\_, opts*)

Creates the project structure as dictionary of dictionaries

**Parameters**

- **struct** (*dict*) – previous directory structure (ignored)
- **opts** (*dict*) – options of the project

**Returns** structure as dictionary of dictionaries and input options

**Return type** `tuple(dict, dict)`

### 12.1.11 pyscaffold.termui module

Basic support for ANSI code formatting.

`pyscaffold.termui.curses_available()`

Check if the curses package from stdlib is available.

Usually not available for windows, but its presence indicates that the terminal is capable of displaying some UI.

**Returns** result of check

**Return type** `bool`

`pyscaffold.termui.decorate(msg, *styles)`

Use ANSI codes to format the message.

**Parameters**

- **msg** (*str*) – string to be formatted
- **\*styles** (*list*) – the remaining arguments should be strings that represent the 8 basic ANSI colors. `clear` and `bold` are also supported. For background colors use `on_<color>`.

**Returns** styled and formatted message

**Return type** `str`

`pyscaffold.termui.init_colorama()`

Initialize colorama if it is available.

**Returns** result of check

**Return type** `bool`

`pyscaffold.termui.isatty(stream=None)`

Detect if the given stream/stdout is part of an interactive terminal.

**Parameters** **stream** – optionally the stream to check

**Returns** result of check

**Return type** `bool`

`pyscaffold.termui.supports_color(stream=None)`

Check if the stream is supposed to handle coloring.

**Returns** result of check

**Return type** `bool`

### 12.1.12 pyscaffold.utils module

Miscellaneous utilities and tools

`pyscaffold.utils.best_fit_license(txt)`

Finds proper license name for the license defined in txt

**Parameters** **txt** (*str*) – license name

**Returns** license name

**Return type** `str`

`pyscaffold.utils.chdir` (*path*, *\*\*kwargs*)

Contextmanager to change into a directory

**Parameters** `path` (*str*) – path to change current working directory to

**Keyword Arguments**

- `log` (*bool*) – log activity when true. Default: `False`.
- `pretend` (*bool*) – skip execution (but log) when pretending. Default `False`.

`pyscaffold.utils.check_setuptools_version` ()

Check minimum required version of setuptools

Check that setuptools has all necessary capabilities for `setuptools_scm` as well as support for configuration with the help of `setup.cfg`.

**Raises** `OldSetuptools` – raised if necessary capabilities are not met

`pyscaffold.utils.create_directory` (*path*, *update=False*, *pretend=False*)

Create a directory in the given path.

This function reports the operation in the logs.

**Parameters**

- `path` (*str*) – path in the file system where contents will be written.
- `update` (*bool*) – false by default. A `OSError` is raised when update is false and the directory already exists.
- `pretend` (*bool*) – false by default. Directory is not created when pretending, but operation is logged.

`pyscaffold.utils.create_file` (*path*, *content*, *pretend=False*)

Create a file in the given path.

This function reports the operation in the logs.

**Parameters**

- `path` (*str*) – path in the file system where contents will be written.
- `content` (*str*) – what will be written.
- `pretend` (*bool*) – false by default. File is not written when pretending, but operation is logged.

`pyscaffold.utils.dasherize` (*word*)

Replace underscores with dashes in the string.

Example:

```
>>> dasherize("foo_bar")
"foo-bar"
```

**Parameters** `word` (*str*) – input word

**Returns** input word with underscores replaced by dashes

`pyscaffold.utils.exceptions2exit` (*exception\_list*)

Decorator to convert given exceptions to exit messages

This avoids displaying nasty stack traces to end-users

**Parameters** `[Exception]` (*exception\_list*) – list of exceptions to convert

`pyscaffold.utils.is_valid_identifier` (*string*)

Check if string is a valid package name

**Parameters** `string` (*str*) – package name

**Returns** True if string is valid package name else False

**Return type** `bool`

`pyscaffold.utils.levenshtein` (*s1*, *s2*)

Calculate the Levenshtein distance between two strings

**Parameters**

- `s1` (*str*) – first string
- `s2` (*str*) – second string

**Returns** distance between *s1* and *s2*

**Return type** `int`

`pyscaffold.utils.list2str` (*lst*, *indent=0*, *brackets=True*, *quotes=True*, *sep=', '*)

Generate a Python syntax list string with an indentation

**Parameters**

- `lst` (*[str]*) – list of strings
- `indent` (*int*) – indention
- `brackets` (*bool*) – surround the list expression by brackets
- `quotes` (*bool*) – surround each item with quotes
- `sep` (*str*) – separator for each item

**Returns** string representation of the list

**Return type** `str`

`pyscaffold.utils.make_valid_identifier` (*string*)

Try to make a valid package name identifier from a string

**Parameters** `string` (*str*) – invalid package name

**Returns** valid package name as string or `RuntimeError`

**Return type** `str`

**Raises** `InvalidIdentifier` – raised if identifier can not be converted

`pyscaffold.utils.move` (*\*src*, *\*\*kwargs*)

Move files or directories to (into) a new location

**Parameters** `*src` (*str*[]) – one or more files/directories to be moved

**Keyword Arguments**

- `target` (*str*) – if target is a directory, `src` will be moved inside it. Otherwise, it will be the new path (note that it may be overwritten)
- `log` (*bool*) – log activity when true. Default: `False`.
- `pretend` (*bool*) – skip execution (but log) when pretending. Default `False`.

`pyscaffold.utils.prepare_namespace` (*namespace\_str*)

Check the validity of `namespace_str` and split it up into a list

**Parameters** `namespace_str` (*str*) – namespace, e.g. “com.blue\_yonder”

**Returns** list of namespaces, e.g. [“com”, “com.blue\_yonder”]

**Return type** [str]

**Raises** `InvalidIdentifier` – raised if namespace is not valid

`pyscaffold.utils.utf8_decode` (*string*)

Decode a Python 2 str object to unicode for compatibility with Python 3

**Parameters** `string` (*str*) – Python 2 str object or Python 3 str object

**Returns** Python 2 unicode object or Python 3 str object

**Return type** str

`pyscaffold.utils.utf8_encode` (*string*)

Encode a Python 2 unicode object to str for compatibility with Python 3

**Parameters** `string` (*str*) – Python 2 unicode object or Python 3 str object

**Returns** Python 2 str object or Python 3 str object

**Return type** str
