# **python-cheatsheet Documentation**

*Release 0.1.0*

**crazyguitar**

**Jul 18, 2018**

|          |   |          |
|----------|---|----------|
| <b>1</b> | <b>Python basic cheatsheet</b>                    | <b>3</b> |
| 1.1      | Python Naming Rule                                | 4        |
| 1.2      | Using <code>__future__</code> backport features   | 5        |
| 1.3      | Check object attributes                           | 6        |
| 1.4      | Define a function <code>__doc__</code>            | 6        |
| 1.5      | Check instance type                               | 6        |
| 1.6      | Check, Get, Set attribute                         | 7        |
| 1.7      | Check inheritance                                 | 7        |
| 1.8      | Check all global variables                        | 7        |
| 1.9      | Check <b>callable</b>                             | 8        |
| 1.10     | Get function/class name                           | 8        |
| 1.11     | <code>__new__</code> & <code>__init__</code>      | 8        |
| 1.12     | The diamond problem                               | 9        |
| 1.13     | Representations of your class behave              | 9        |
| 1.14     | Break up a long string                            | 9        |
| 1.15     | Get list item <b>SMART</b>                        | 10       |
| 1.16     | Get dictionary item <b>SMART</b>                  | 11       |
| 1.17     | Set a list/dict <b>SMART</b>                      | 12       |
| 1.18     | set operations                                    | 12       |
| 1.19     | NamedTuple  | 14       |
| 1.20     | <code>__iter__</code> - Delegating Iteration      | 14       |
| 1.21     | Using Generator as Iterator                       | 15       |
| 1.22     | Emulating a list                                  | 15       |
| 1.23     | Emulating a dictionary                            | 16       |
| 1.24     | Decorator   | 17       |
| 1.25     | Decorator with arguments                          | 18       |
| 1.26     | <code>for: exp else: exp</code>                   | 18       |
| 1.27     | <code>try: exp else: exp</code>                   | 19       |
| 1.28     | Lambda function                                   | 19       |
| 1.29     | Option arguments - <code>(*args, **kwargs)</code> | 20       |
| 1.30     | <code>type()</code> declare (create) a class      | 20       |
| 1.31     | Callable object                                   | 21       |
| 1.32     | Context Manager - <code>with</code> statement     | 21       |
| 1.33     | Using <code>@contextmanager</code>                | 22       |
| 1.34     | Using <code>with</code> statement open file       | 22       |
| 1.35     | Reading file chunk                                | 22       |

|          |   |           |
|----------|---|-----------|
| 1.36     | Property - Managed attributes                               | 22        |
| 1.37     | Computed attributes - Using property                        | 23        |
| 1.38     | Descriptor - manage attributes                              | 23        |
| 1.39     | @staticmethod, @classmethod                                 | 24        |
| 1.40     | Abstract method - Metaclass                                 | 25        |
| 1.41     | Common Use <b>Magic</b>                                     | 25        |
| 1.42     | Parsing csv string  | 27        |
| 1.43     | Using <code>__slots__</code> to save memory                 | 27        |
| 1.44     | Using annotation for type hints                             | 28        |
| 1.45     | Using annotation to check type                              | 29        |
| <b>2</b> | <b>New in Python3 cheatsheet</b>                            | <b>33</b> |
| 2.1      | <code>print</code> is a function                            | 34        |
| 2.2      | String is unicode   | 34        |
| 2.3      | Division Operator   | 35        |
| 2.4      | Keyword-Only Arguments                                      | 35        |
| 2.5      | New Super   | 36        |
| 2.6      | Remove <code>&lt;&gt;</code>                                | 37        |
| 2.7      | Not allow from module <code>import *</code> inside function | 37        |
| 2.8      | Add <code>nonlocal</code> keyword                           | 37        |
| 2.9      | Extended iterable unpacking                                 | 38        |
| 2.10     | General unpacking   | 38        |
| 2.11     | Function annotations  | 39        |
| 2.12     | Variable annotations  | 39        |
| 2.13     | Core support for typing module and generic types            | 39        |
| 2.14     | Format byte string  | 40        |
| 2.15     | <code>fstring</code>  | 40        |
| 2.16     | Suppressing exception                                       | 41        |
| 2.17     | Generator delegation  | 42        |
| 2.18     | <code>async</code> and <code>await</code> syntax            | 42        |
| 2.19     | Asynchronous generators                                     | 43        |
| 2.20     | Asynchronous comprehensions                                 | 43        |
| 2.21     | Matrix multiplication                                       | 44        |
| 2.22     | Data Classes  | 45        |
| 2.23     | Built-in <code>breakpoint()</code>                          | 46        |
| <b>3</b> | <b>Python unicode cheatsheet</b>                            | <b>47</b> |
| 3.1      | Encode: unicode code point to bytes                         | 47        |
| 3.2      | Decode: bytes to unicode code point                         | 47        |
| 3.3      | Get unicode code point                                      | 48        |
| 3.4      | python2 <code>str</code> is equivalent to byte string       | 48        |
| 3.5      | python3 <code>str</code> is equivalent to unicode string    | 48        |
| 3.6      | python2 take <code>str</code> char as byte character        | 49        |
| 3.7      | python3 take <code>str</code> char as unicode character     | 49        |
| 3.8      | unicode normalization                                       | 49        |
| <b>4</b> | <b>Python generator cheatsheet</b>                          | <b>51</b> |
| 4.1      | Glossary of Generator                                       | 52        |
| 4.2      | Produce value via generator                                 | 53        |
| 4.3      | Unpacking Generators  | 53        |
| 4.4      | Implement Iterable object via generator                     | 54        |
| 4.5      | Send message to generator                                   | 54        |
| 4.6      | <code>yield from</code> expression                          | 55        |
| 4.7      | <code>yield (from) EXPR return RES</code>                   | 56        |

|          |   |           |
|----------|---|-----------|
| 4.8      | Generate sequences  | 56        |
| 4.9      | What <code>RES = yield from EXP</code> actually do?               | 57        |
| 4.10     | <code>for _ in gen()</code> simulate <code>yield from</code>      | 58        |
| 4.11     | Check generator type  | 58        |
| 4.12     | Check Generator State   | 58        |
| 4.13     | Simple compiler   | 59        |
| 4.14     | Context manager and generator                                     | 61        |
| 4.15     | What <code>@contextmanager</code> actually doing?                 | 61        |
| 4.16     | profile code block  | 62        |
| 4.17     | <code>yield from</code> and <code>__iter__</code>                 | 63        |
| 4.18     | <code>yield from == await</code> expression                       | 63        |
| 4.19     | Closure in Python - using generator                               | 64        |
| 4.20     | Implement a simple scheduler                                      | 65        |
| 4.21     | Simple round-robin with blocking                                  | 66        |
| 4.22     | simple round-robin with blocking and non-blocking                 | 67        |
| 4.23     | Asynchronous Generators   | 69        |
| 4.24     | Asynchronous generators can have <code>try..finally</code> blocks | 69        |
| 4.25     | send value and throw exception into async generator               | 69        |
| 4.26     | Simple async round-robin  | 70        |
| 4.27     | Async generator get better performance than async iterator        | 71        |
| 4.28     | Asynchronous Comprehensions                                       | 71        |
| <b>5</b> | <b>Python Regular Expression cheatsheet</b>                       | <b>75</b> |
| 5.1      | Compare HTML tags   | 76        |
| 5.2      | <code>re.findall()</code> match string                            | 76        |
| 5.3      | Group Comparison  | 77        |
| 5.4      | Non capturing group   | 77        |
| 5.5      | Back Reference  | 77        |
| 5.6      | Named Grouping ( <code>?P&lt;name&gt;</code> )                    | 78        |
| 5.7      | Substitute String   | 78        |
| 5.8      | Look around   | 79        |
| 5.9      | Match common username or password                                 | 79        |
| 5.10     | Match hex color value   | 79        |
| 5.11     | Match email   | 79        |
| 5.12     | Match URL   | 80        |
| 5.13     | Match IP address  | 80        |
| 5.14     | Match Mac address   | 80        |
| 5.15     | Lexer   | 81        |
| <b>6</b> | <b>Python socket cheatsheet</b>                                   | <b>83</b> |
| 6.1      | Get Hostname  | 84        |
| 6.2      | Get address family and socket address from string                 | 84        |
| 6.3      | Transform Host & Network Endian                                   | 85        |
| 6.4      | IP dotted-quad string & byte format convert                       | 86        |
| 6.5      | Mac address & byte format convert                                 | 86        |
| 6.6      | Simple TCP Echo Server  | 86        |
| 6.7      | Simple TCP Echo Server through IPv6                               | 87        |
| 6.8      | Disable IPv6 Only   | 87        |
| 6.9      | Simple TCP Echo Server Via SocketServer                           | 88        |
| 6.10     | Simple TLS/SSL TCP Echo Server                                    | 89        |
| 6.11     | Set ciphers on TLS/SSL TCP Echo Server                            | 90        |
| 6.12     | Simple UDP Echo Server  | 91        |
| 6.13     | Simple UDP Echo Server Via SocketServer                           | 91        |
| 6.14     | Simple UDP client - Sender  | 92        |

|          |  |            |
|----------|--|------------|
| 6.15     | Broadcast UDP Packets                                  | 92         |
| 6.16     | Simple UNIX Domain Socket                              | 92         |
| 6.17     | Simple duplex processes communication                  | 93         |
| 6.18     | Simple Asynchronous TCP Server - Thread                | 94         |
| 6.19     | Simple Asynchronous TCP Server - select                | 94         |
| 6.20     | Simple Asynchronous TCP Server - poll                  | 95         |
| 6.21     | Simple Asynchronous TCP Server - epoll                 | 97         |
| 6.22     | Simple Asynchronous TCP Server - kqueue                | 99         |
| 6.23     | High-Level API - selectors                             | 102        |
| 6.24     | Simple Non-blocking TLS/SSL socket via selectors       | 103        |
| 6.25     | “socketpair” - Similar to PIPE                         | 105        |
| 6.26     | Using sendfile do copy                                 | 106        |
| 6.27     | Sending a file through sendfile                        | 106        |
| 6.28     | Linux kernel Crypto API - AF_ALG                       | 108        |
| 6.29     | AES-CBC encrypt/decrypt via AF_ALG                     | 109        |
| 6.30     | AES-GCM encrypt/decrypt via AF_ALG                     | 110        |
| 6.31     | AES-GCM encrypt/decrypt file with sendfile             | 112        |
| 6.32     | Compare the performance of AF_ALG to cryptography      | 114        |
| 6.33     | Sniffer IP packets                                     | 116        |
| 6.34     | Sniffer TCP packet                                     | 118        |
| 6.35     | Sniffer ARP packet                                     | 121        |
| <b>7</b> | <b>Python cryptography cheatsheet</b>                  | <b>123</b> |
| 7.1      | Simple https server                                    | 124        |
| 7.2      | Check certificate information                          | 124        |
| 7.3      | Generate a self-signed certificate                     | 126        |
| 7.4      | Prepare a Certificate Signing Request (csr)            | 127        |

- *Using annotation to check type*

## 1.1 Python Naming Rule

```
# see: PEP 8  
  
# for class  
#  
# good:  
# MyClass  
# bad:  
# myClass, my_class
```

(continues on next page)

(continued from previous page)

```

MyClass

# for func, module, package, variables
#
# good:
#   var_underscore_separate
# bad:
#   varCamel, VarCamel
var_underscore_separate

# for public use
var

# for internal use
_var

# convention to avoid conflict keyword
var_

# for private use in class
__var

# for protect use in class
_var_

# "magic" method or attributes
# ex: __init__, __file__, __main__
__var__

# for "internal" use throwaway variable
# usually used in loop
# ex: [_ for _ in range(10)]
# or variable not used
# for _, a in [(1,2), (3,4)]: print a
_

```

## 1.2 Using `__future__` backport features

```

# PEP 236 - Back to the __future__

# backport python3 print_function in python2

>>> print "Hello World" # print is a statement
Hello World
>>> from __future__ import print_function
>>> print "Hello World"
File "<stdin>", line 1
    print "Hello World"
      ^
SyntaxError: invalid syntax
>>> print("Hello World") # print become a function
Hello World

# backport python3 unicode_literals in python2

```

(continues on next page)

(continued from previous page)

```
>>> type("Guido") # string type is str in python2
<type 'str'>
>>> from __future__ import unicode_literals
>>> type("Guido") # string type become unicode
<type 'unicode'>

# backport PEP 238 -- Changing the Division Operator

>>> 1/2
0
>>> from __future__ import division
>>> 1/2 # return a float (classic division)
0.5
>>> 1//2 # return a int (floor division)
0
```

---

**Note:** `from __future__ import` feature is a future statement. It use for backporting features of other python version to current python version, not like original import.

---

### 1.3 Check object attributes

```
# example of check list attributes
>>> dir(list)
['__add__', '__class__', ...]
```

### 1.4 Define a function `__doc__`

```
# Define a function document
>>> def example():
...     """ This is an example function """
...     print("Example function")
...
>>> example.__doc__
' This is an example function '

# Or using help function
>>> help(example)
```

### 1.5 Check instance type

```
>>> ex = 10
>>> isinstance(ex,int)
True
```

## 1.6 Check, Get, Set attribute

```
>>> class Example(object):
...     def __init__(self):
...         self.name = "ex"
...     def printex(self):
...         print("This is an example")
...

# Check object has attributes
# hasattr(obj, 'attr')
>>> ex = Example()
>>> hasattr(ex, "name")
True
>>> hasattr(ex, "printex")
True
>>> hasattr(ex, "print")
False

# Get object attribute
# getattr(obj, 'attr')
>>> getattr(ex, 'name')
'ex'

# Set object attribute
# setattr(obj, 'attr', value)
>>> setattr(ex, 'name', 'example')
>>> ex.name
'example'
```

## 1.7 Check inheritance

```
>>> class Example(object):
...     def __init__(self):
...         self.name = "ex"
...     def printex(self):
...         print("This is an Example")
...
>>> isinstance(Example, object)
True
```

## 1.8 Check all global variables

```
# globals() return a dictionary
# {'variable name': variable value}
>>> globals()
{'args': (1, 2, 3, 4, 5), ...}
```

## 1.9 Check callable

```
>>> a = 10
>>> def fun():
...     print("I am callable")
...
>>> callable(a)
False
>>> callable(fun)
True
```

## 1.10 Get function/class name

```
>>> class ExampleClass(object):
...     pass
...
>>> def example_function():
...     pass
...
>>> ex = ExampleClass()
>>> ex.__class__.__name__
'ExampleClass'
>>> example_function.__name__
'example_function'
```

## 1.11 `__new__` & `__init__`

```
# __init__ will be invoked
>>> class ClassA(object):
...     def __new__(cls, arg):
...         print('__new__ ' + arg)
...         return object.__new__(cls, arg)
...     def __init__(self, arg):
...         print('__init__ ' + arg)
...
>>> o = ClassA("Hello")
__new__ Hello
__init__ Hello

# __init__ won't be invoked
>>> class ClassB(object):
...     def __new__(cls, arg):
...         print('__new__ ' + arg)
...         return object
...     def __init__(self, arg):
...         print('__init__ ' + arg)
...
>>> o = ClassB("Hello")
__new__ Hello
```

## 1.12 The diamond problem

```
# The problem of multiple inheritance in searching a method

>>> def foo_a(self):
...     print("This is ClsA")
...
>>> def foo_b(self):
...     print("This is ClsB")
...
>>> def foo_c(self):
...     print("This is ClsC")
...
>>> class Type(type):
...     def __repr__(cls):
...         return cls.__name__
...
>>> ClsA = Type("ClsA", (object,), {'foo': foo_a})
>>> ClsB = Type("ClsB", (ClsA,), {'foo': foo_b})
>>> ClsC = Type("ClsC", (ClsA,), {'foo': foo_c})
>>> ClsD = Type("ClsD", (ClsB, ClsC), {})
>>> ClsD.mro()
[ClsD, ClsB, ClsC, ClsA, <type 'object'>]
>>> ClsD().foo()
This is ClsB
```

## 1.13 Representations of your class behave

```
>>> class Example(object):
...     def __str__(self):
...         return "Example __str__"
...     def __repr__(self):
...         return "Example __repr__"
...
>>> print(str(Example()))
Example __str__
>>> Example()
Example __repr__
```

## 1.14 Break up a long string

```
# original long string
>>> s = 'This is a very very very long python string'
>>> s
'This is a very very very long python string'

# single quote with an escaping backslash
>>> s = "This is a very very very " \
...     "long python string"
>>> s
'This is a very very very long python string'
```

(continues on next page)

(continued from previous page)

```
# using brackets
>>> s = ("This is a very very very "
...      "long python string")
>>> s
'This is a very very very long python string'

# using '+'
>>> s = ("This is a very very very " +
...      "long python string")
>>> s
'This is a very very very long python string'

# using triple-quote with an escaping backslash
>>> s = '''This is a very very very \
... long python string'''
>>> s
'This is a very very very long python string'
```

## 1.15 Get list item SMART

```
>>> a = [1, 2, 3, 4, 5]
>>> a[0]
1
>>> a[-1]
5
>>> a[0:]
[1, 2, 3, 4, 5]
>>> a[:-1]
[1, 2, 3, 4]

# a[start:end:step]
>>> a[0:-1:2]
[1, 3]

# using slice object
# slice(start,end,step)
>>> s = slice(0, -1, 2)
>>> a[s]
[1, 3]

# Get index and item in loop
>>> for i, v in enumerate(range(3)):
...     print((i, v))
...
(0, 0)
(1, 1)
(2, 2)

# Transfer two list into tuple list
>>> a = [1, 2, 3, 4, 5]
>>> b = [2, 4, 5, 6, 8]
>>> zip(a, b)
[(1, 2), (2, 4), (3, 5), (4, 6), (5, 8)]
```

(continues on next page)

(continued from previous page)

```

# with filter
>>> [x for x in range(5) if x > 1]
[2, 3, 4]
>>> l = ['1', '2', 3, 'Hello', 4]
>>> predicate = lambda x: isinstance(x, int)
>>> filter(predicate, l)
[3, 4]

# collect distinct objects
>>> a = [1, 2, 3, 3, 3]
>>> list({_ for _ in a})
[1, 2, 3]
# or
>>> list(set(a))
[1, 2, 3]

# reverse
>>> a = [1, 2, 3, 4, 5]
>>> a[::-1]
[5, 4, 3, 2, 1]

# be careful
>>> a = [[] * 3]
>>> b = [[] for _ in range(3)]
>>> a[0].append("Hello")
>>> a
[['Hello'], ['Hello'], ['Hello']]
>>> b[0].append("Python")
>>> b
[['Python'], [], []]

```

## 1.16 Get dictionary item SMART

```

# get dictionary all keys
>>> a = {"1":1, "2":2, "3":3}
>>> b = {"2":2, "3":3, "4":4}
>>> a.keys()
['1', '3', '2']

# get dictionary key and value as tuple
>>> a.items()
[('1', 1), ('3', 3), ('2', 2)]

# find same key between two dictionary
>>> [_ for _ in a.keys() if _ in b.keys()]
['3', '2']
# better way
>>> c = set(a).intersection(set(b))
>>> list(c)
['3', '2']
# or
>>> [_ for _ in a if _ in b]
['3', '2']

```

(continues on next page)

(continued from previous page)

```
# update dictionary
>>> a.update(b)
>>> a
{'1': 1, '3': 3, '2': 2, '4': 4}

# merge two dictionaries (python 3.4 or lower)
>>> a = {"x": 55, "y": 66}
>>> b = {"a": "foo", "b": "bar"}
>>> c = a.copy()
>>> c.update(b)
>>> c
{'y': 66, 'x': 55, 'b': 'bar', 'a': 'foo'}

# merge two dictionaries (python 3.5 or above)
>>> a = {"x": 55, "y": 66}
>>> b = {"a": "foo", "b": "bar"}
>>> c = {**a, **b}
>>> c
{'x': 55, 'y': 66, 'a': 'foo', 'b': 'bar'}
```

## 1.17 Set a list/dict SMART

```
# get a list with init value
>>> ex = [0] * 10
>>> ex
[0, 0, 0, 0, 0, 0, 0, 0, 0, 0]

# extend two list
>>> a = [1, 2, 3]; b = ['a', 'b']
>>> a + b
[1, 2, 3, 'a', 'b']

# using list comprehension
>>> [x for x in range(10)]
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9]
>>> fn = lambda x: x**2
>>> [fn(x) for x in range(5)]
[0, 1, 4, 9, 16]
>>> {'{0}'.format(x): x for x in range(3)}
{'1': 1, '0': 0, '2': 2}

# using builtin function "map"
>>> map(fn, range(5))
[0, 1, 4, 9, 16]
```

## 1.18 set operations

```
# set comprehension
>>> a = [1, 2, 5, 6, 6, 6, 7]
>>> s = {x for x in a}
```

(continues on next page)

(continued from previous page)

```
>>> s
set([1, 2, 5, 6, 7])
>>> s = {x for x in a if x > 3}
>>> s
set([5, 6, 7])
>>> s = {x if x > 3 else -1 for x in a}
>>> s
set([6, 5, -1, 7])

# uniquify list
>>> a = [1, 2, 2, 2, 3, 4, 5, 5]
>>> a
[1, 2, 2, 2, 3, 4, 5, 5]
>>> ua = list(set(a))
>>> ua
[1, 2, 3, 4, 5]

# union two set
>>> a = set([1, 2, 2, 2, 3])
>>> b = set([5, 5, 6, 6, 7])
>>> a | b
set([1, 2, 3, 5, 6, 7])
# or
>>> a = [1, 2, 2, 2, 3]
>>> b = [5, 5, 6, 6, 7]
>>> set(a + b)
set([1, 2, 3, 5, 6, 7])

# append item to set
>>> a = set([1, 2, 3, 3, 3])
>>> a.add(5)
>>> a
set([1, 2, 3, 5])
# or
>>> a = set([1, 2, 3, 3, 3])
>>> a |= set([1, 2, 3, 4, 5, 6])
>>> a
set([1, 2, 3, 4, 5, 6])

# intersection two set
>>> a = set([1, 2, 2, 2, 3])
>>> b = set([1, 5, 5, 6, 6, 7])
>>> a & b
set([1])

# get two list common items
>>> a = [1, 1, 2, 3]
>>> b = [1, 3, 5, 5, 6, 6]
>>> com = list(set(a) & set(b))
>>> com
[1, 3]

# b contains a
>>> a = set([1, 2])
>>> b = set([1, 2, 5, 6])
>>> a <= b
True
```

(continues on next page)

(continued from previous page)

```
# a contains b
>>> a = set([1, 2, 5, 6])
>>> b = set([1, 5, 6])
>>> a >= b
True

# set diff
>>> a = set([1, 2, 3])
>>> b = set([1, 5, 6, 7, 7])
>>> a - b
set([2, 3])

# symmetric diff
>>> a = set([1,2,3])
>>> b = set([1, 5, 6, 7, 7])
>>> a ^ b
set([2, 3, 5, 6, 7])
```

## 1.19 NamedTuple

```
# namedtuple(typename, field_names)
# replace define class without method
>>> from collections import namedtuple
>>> Example = namedtuple("Example", 'a b c')
>>> e = Example(1, 2, 3)
>>> print(e.a, e[1], e[1] + e.b)
1 2 4
```

## 1.20 `__iter__` - Delegating Iteration

```
# __iter__ return an iterator object
# Be careful: list is an "iterable" object not an "iterator"
>>> class Iter(object):
...     def __init__(self, list_):
...         self._list = list_
...     def __iter__(self):
...         return iter(self._list)
...
>>> it = Iter([1, 2, 3])
>>> for i in it:
...     print(i)
...
1
2
3
```

## 1.21 Using Generator as Iterator

```
# see: PEP289
>>> for x in g:
...     print(x, end=' ')
... else:
...     print()
...
0 1 2 3 4 5 6 7 8 9

# equivalent to
>>> def generator():
...     for x in range(10):
...         yield x
...
>>> g = generator()
>>> for x in g:
...     print(x, end=' ')
... else:
...     print()
...
0 1 2 3 4 5 6 7 8 9
```

## 1.22 Emulating a list

```
>>> class EmuList(object):
...     def __init__(self, list_):
...         self._list = list_
...     def __repr__(self):
...         return "EmuList: " + repr(self._list)
...     def append(self, item):
...         self._list.append(item)
...     def remove(self, item):
...         self._list.remove(item)
...     def __len__(self):
...         return len(self._list)
...     def __getitem__(self, sliced):
...         return self._list[sliced]
...     def __setitem__(self, sliced, val):
...         self._list[sliced] = val
...     def __delitem__(self, sliced):
...         del self._list[sliced]
...     def __contains__(self, item):
...         return item in self._list
...     def __iter__(self):
...         return iter(self._list)
...
>>> emul = EmuList(range(5))
>>> emul
EmuList: [0, 1, 2, 3, 4]
>>> emul[1:3] # __getitem__
[1, 2]
>>> emul[0:4:2] # __getitem__
[0, 2]
```

(continues on next page)

(continued from previous page)

```
>>> len(emul) # __len__
5
>>> emul.append(5)
>>> emul
EmuList: [0, 1, 2, 3, 4, 5]
>>> emul.remove(2)
>>> emul
EmuList: [0, 1, 3, 4, 5]
>>> emul[3] = 6 # __setitem__
>>> emul
EmuList: [0, 1, 3, 6, 5]
>>> 0 in emul # __contains__
True
```

## 1.23 Emulating a dictionary

```
>>> class EmuDict(object):
...     def __init__(self, dict_):
...         self._dict = dict_
...     def __repr__(self):
...         return "EmuDict: " + repr(self._dict)
...     def __getitem__(self, key):
...         return self._dict[key]
...     def __setitem__(self, key, val):
...         self._dict[key] = val
...     def __delitem__(self, key):
...         del self._dict[key]
...     def __contains__(self, key):
...         return key in self._dict
...     def __iter__(self):
...         return iter(self._dict.keys())
...
>>> _ = {"1":1, "2":2, "3":3}
>>> emud = EmuDict(_)
>>> emud # __repr__
EmuDict: {'1': 1, '2': 2, '3': 3}
>>> emud['1'] # __getitem__
1
>>> emud['5'] = 5 # __setitem__
>>> emud
EmuDict: {'1': 1, '2': 2, '3': 3, '5': 5}
>>> del emud['2'] # __delitem__
>>> emud
EmuDict: {'1': 1, '3': 3, '5': 5}
>>> for _ in emud:
...     print(emud[_], end=' ') # __iter__
... else:
...     print()
...
1 3 5
>>> '1' in emud # __contains__
True
```

## 1.24 Decorator

```
# see: PEP318
>>> from functools import wraps
>>> def decorator(func):
...     @wraps(func)
...     def wrapper(*args, **kwargs):
...         print("Before calling {}".format(func.__name__))
...         ret = func(*args, **kwargs)
...         print("After calling {}".format(func.__name__))
...         return ret
...     return wrapper
...
>>> @decorator
... def example():
...     print("Inside example function.")
...
>>> example()
Before calling example.
Inside example function.
After calling example.

# equivalent to
... def example():
...     print("Inside example function.")
...
>>> example = decorator(example)
>>> example()
Before calling example.
Inside example function.
After calling example.
```

**Note:** @wraps preserve attributes of the original function, otherwise attributes of decorated function will be replaced by wrapper function

```
# without @wraps
>>> def decorator(func):
...     def wrapper(*args, **kwargs):
...         print('wrap function')
...         return func(*args, **kwargs)
...     return wrapper
...
>>> @decorator
... def example(*a, **kw):
...     pass
...
>>> example.__name__ # attr of function lose
'wrapper'

# with @wraps
>>> from functools import wraps
>>> def decorator(func):
...     @wraps(func)
...     def wrapper(*args, **kwargs):
...         print('wrap function')
```

(continues on next page)

(continued from previous page)

```

...     return func(*args, **kwargs)
...     return wrapper
...
>>> @decorator
... def example(*a, **kw):
...     pass
...
>>> example.__name__ # attr of function preserve
'example'

```

## 1.25 Decorator with arguments

```

>>> from functools import wraps
>>> def decorator_with_argument(val):
...     def decorator(func):
...         @wraps(func)
...         def wrapper(*args, **kwargs):
...             print("Val is {0}".format(val))
...             return func(*args, **kwargs)
...         return wrapper
...     return decorator
...
>>> @decorator_with_argument(10)
... def example():
...     print("This is example function.")
...
>>> example()
Val is 10
This is example function.

# equivalent to
>>> def example():
...     print("This is example function.")
...
>>> example = decorator_with_argument(10)(example)
>>> example()
Val is 10
This is example function.

```

## 1.26 for: exp else: exp

```

# see document: More Control Flow Tools
# forloop's else clause runs when no break occurs
>>> for x in range(5):
...     print(x, end=' ')
... else:
...     print("\nno break occurred")
...
0 1 2 3 4
no break occurred
>>> for x in range(5):

```

(continues on next page)

(continued from previous page)

```

...     if x % 2 == 0:
...         print("break occurred")
...         break
...     else:
...         print("no break occurred")
...
break occurred

# above statement equivalent to
>>> flag = False
>>> for x in range(5):
...     if x % 2 == 0:
...         flag = True
...         print("break occurred")
...         break
...
... if flag == False:
...     print("no break occurred")
...
break occurred

```

## 1.27 try: exp else: exp

```

# No exception occur will go into else.
>>> try:
...     print("No exception")
... except:
...     pass
... else:
...     print("No exception occurred")
...
No exception
No exception occurred

```

## 1.28 Lambda function

```

>>> fn = lambda x: x**2
>>> fn(3)
9
>>> (lambda x: x**2)(3)
9
>>> (lambda x: [x*_ for _ in range(5)])(2)
[0, 2, 4, 6, 8]
>>> (lambda x: x if x>3 else 3)(5)
5

# multiline lambda example
>>> (lambda x:
... True
... if x>0
... else

```

(continues on next page)

(continued from previous page)

```
... False) (3)
True
```

## 1.29 Option arguments - (\*args, \*\*kwargs)

```
>>> def example(a, b=None, *args, **kwargs):
...     print(a, b)
...     print(args)
...     print(kwargs)
...
>>> example(1, "var", 2, 3, word="hello")
1 var
(2, 3)
{'word': 'hello'}
>>> a_tuple = (1, 2, 3, 4, 5)
>>> a_dict = {"1":1, "2":2, "3":3}
>>> example(1, "var", *a_tuple, **a_dict)
1 var
(1, 2, 3, 4, 5)
{'1': 1, '2': 2, '3': 3}
```

## 1.30 type() declare (create) a class

```
>>> def fib(self, n):
...     if n <= 2:
...         return 1
...     return fib(self, n-1) + fib(self, n-2)
...
>>> Fib = type('Fib', (object,), {'val': 10,
...                               'fib': fib})
>>> f = Fib()
>>> f.val
10
>>> f.fib(f.val)
55

# equal to
>>> class Fib(object):
...     val = 10
...     def fib(self, n):
...         if n <=2:
...             return 1
...         return self.fib(n-1)+self.fib(n-2)
...
>>> f = Fib()
>>> f.val
10
>>> f.fib(f.val)
55
```

## 1.31 Callable object

```
>>> class CallableObject(object):
...     def example(self, *args, **kwargs):
...         print("I am callable!")
...     def __call__(self, *args, **kwargs):
...         self.example(*args, **kwargs)
...
>>> ex = CallableObject()
>>> ex()
I am callable!
```

## 1.32 Context Manager - with statement

```
# replace try: ... finally: ...
# see: PEP343
# common use in open and close

import socket

class Socket(object):
    def __init__(self, host, port):
        self.host = host
        self.port = port

    def __enter__(self):
        sock = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
        sock.bind((self.host, self.port))
        sock.listen(5)
        self.sock = sock
        return self.sock

    def __exit__(self, *exc_info):
        if exc_info[0] is not None:
            import traceback
            traceback.print_exception(*exc_info)
        self.sock.close()

if __name__ == "__main__":
    host = 'localhost'
    port = 5566
    with Socket(host, port) as s:
        while True:
            conn, addr = s.accept()
            msg = conn.recv(1024)
            print(msg)
            conn.send(msg)
            conn.close()
```

## 1.33 Using @contextmanager

```
from contextlib import contextmanager

@contextmanager
def opening(filename, mode='r'):
    f = open(filename, mode)
    try:
        yield f
    finally:
        f.close()

with opening('example.txt') as fd:
    fd.read()
```

## 1.34 Using with statement open file

```
>>> with open("/etc/passwd", 'r') as f:
...     content = f.read()
```

## 1.35 Reading file chunk

```
>>> chunk_size = 16
>>> content = ''
>>> with open('/etc/hosts') as f:
...     for c in iter(lambda: f.read(chunk_size), ''):
...         content += c
...
>>> print(content)
127.0.0.1    localhost
255.255.255.255    broadcasthost
::1        localhost

10.245.1.3  www.registry.io
```

## 1.36 Property - Managed attributes

```
>>> class Example(object):
...     def __init__(self, value):
...         self._val = value
...     @property
...     def val(self):
...         return self._val
...     @val.setter
...     def val(self, value):
...         if not isinstance(value, int):
...             raise TypeError("Expected int")
...         self._val = value
```

(continues on next page)

(continued from previous page)

```

...     @val.deleter
...     def val(self):
...         del self._val
...
>>> ex = Example(123)
>>> ex.val = "str"
Traceback (most recent call last):
  File "", line 1, in
  File "test.py", line 12, in val
    raise TypeError("Expected int")
TypeError: Expected int

# equivalent to
>>> class Example(object):
...     def __init__(self, value):
...         self._val = value
...
...     def _val_getter(self):
...         return self._val
...
...     def _val_setter(self, value):
...         if not isinstance(value, int):
...             raise TypeError("Expected int")
...         self._val = value
...
...     def _val_deleter(self):
...         del self._val
...
...     val = property(fget=_val_getter, fset=_val_setter, fdel=_val_deleter,
↳ doc=None)
...

```

## 1.37 Computed attributes - Using property

```

>>> class Example(object):
...     @property
...     def square3(self):
...         return 2**3
...
>>> ex = Example()
>>> ex.square3
8

```

**Note:** @property compute the value of attribute only when we need. Not store in memory previously.

## 1.38 Descriptor - manage attributes

```

>>> class Integer(object):
...     def __init__(self, name):

```

(continues on next page)

(continued from previous page)

```

...     self._name = name
...     def __get__(self, inst, cls):
...         if inst is None:
...             return self
...         else:
...             return inst.__dict__[self._name]
...     def __set__(self, inst, value):
...         if not isinstance(value, int):
...             raise TypeError("Expected int")
...         inst.__dict__[self._name] = value
...     def __delete__(self, inst):
...         del inst.__dict__[self._name]
...
>>> class Example(object):
...     x = Integer('x')
...     def __init__(self, val):
...         self.x = val
...
>>> ex1 = Example(1)
>>> ex1.x
1
>>> ex2 = Example("str")
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "<stdin>", line 4, in __init__
  File "<stdin>", line 11, in __set__
TypeError: Expected an int
>>> ex3 = Example(3)
>>> hasattr(ex3, 'x')
True
>>> del ex3.x
>>> hasattr(ex3, 'x')
False

```

### 1.39 @staticmethod, @classmethod

```

# @classmethod: bound to class
# @staticmethod: like python function but in class
>>> class example(object):
...     @classmethod
...     def clsmethod(cls):
...         print("I am classmethod")
...     @staticmethod
...     def stmethod():
...         print("I am staticmethod")
...     def instmethod(self):
...         print("I am instancemethod")
...
>>> ex = example()
>>> ex.clsmethod()
I am classmethod
>>> ex.stmethod()
I am staticmethod
>>> ex.instmethod()

```

(continues on next page)

(continued from previous page)

```

I am instancemethod
>>> example.clsmethod()
I am classmethod
>>> example.stmethod()
I am staticmethod
>>> example.instmethod()
Traceback (most recent call last):
  File "", line 1, in
TypeError: unbound method instmethod() ...

```

## 1.40 Abstract method - Metaclass

```

# usually using in define methods but not implement
>>> from abc import ABCMeta, abstractmethod
>>> class base(object):
...     __metaclass__ = ABCMeta
...     @abstractmethod
...     def absmethod(self):
...         """ Abstract method """
...
>>> class example(base):
...     def absmethod(self):
...         print("abstract")
...
>>> ex = example()
>>> ex.absmethod()
abstract

# another better way to define a meta class
>>> class base(object):
...     def absmethod(self):
...         raise NotImplementedError
...
>>> class example(base):
...     def absmethod(self):
...         print("abstract")
...
>>> ex = example()
>>> ex.absmethod()
abstract

```

## 1.41 Common Use Magic

```

# see python document: data model
# For command class
__main__
__name__
__file__
__module__
__all__
__dict__

```

(continues on next page)

```
__class__
__doc__
__init__(self, [...])
__str__(self)
__repr__(self)
__del__(self)

# For Descriptor
__get__(self, instance, owner)
__set__(self, instance, value)
__delete__(self, instance)

# For Context Manager
__enter__(self)
__exit__(self, exc_ty, exc_val, tb)

# Emulating container types
__len__(self)
__getitem__(self, key)
__setitem__(self, key, value)
__delitem__(self, key)
__iter__(self)
__contains__(self, value)

# Controlling Attribute Access
__getattr__(self, name)
__setattr__(self, name, value)
__delattr__(self, name)
__getattribute__(self, name)

# Callable object
__call__(self, [args...])

# Compare related
__cmp__(self, other)
__eq__(self, other)
__ne__(self, other)
__lt__(self, other)
__gt__(self, other)
__le__(self, other)
__ge__(self, other)

# arithmetical operation related
__add__(self, other)
__sub__(self, other)
__mul__(self, other)
__div__(self, other)
__mod__(self, other)
__and__(self, other)
__or__(self, other)
__xor__(self, other)
```

## 1.42 Parsing csv string

```
# python2 and python3 compatible

>>> try:
...     from StringIO import StringIO # for py2
... except ImportError:
...     from io import StringIO # for py3
...
>>> import csv
>>> s = "foo,bar,baz"
>>> f = StringIO(s)
>>> for x in csv.reader(f): print(x)
...
['foo', 'bar', 'baz']

# or

>>> import csv
>>> s = "foo,bar,baz"
>>> for x in csv.reader([s]): print(x)
...
['foo', 'bar', 'baz']
```

## 1.43 Using `__slots__` to save memory

```
#!/usr/bin/env python3

import resource
import platform
import functools

def profile_mem(func):
    @functools.wraps(func)
    def wrapper(*a, **k):
        s = resource.getrusage(resource.RUSAGE_SELF).ru_maxrss
        ret = func(*a, **k)
        e = resource.getrusage(resource.RUSAGE_SELF).ru_maxrss

        uname = platform.system()
        if uname == "Linux":
            print(f"mem usage: {e - s} kByte")
        elif uname == "Darwin":
            print(f"mem usage: {e - s} Byte")
        else:
            raise Exception("not support")
        return ret
    return wrapper

class S(object):
    __slots__ = ['attr1', 'attr2', 'attr3']
```

(continues on next page)

(continued from previous page)

```
def __init__(self):
    self.attr1 = "Foo"
    self.attr2 = "Bar"
    self.attr3 = "Baz"

class D(object):

    def __init__(self):
        self.attr1 = "Foo"
        self.attr2 = "Bar"
        self.attr3 = "Baz"

@profile_mem
def alloc(cls):
    _ = [cls() for _ in range(1000000)]

alloc(S)
alloc(D)
```

output:

```
$ python3.6 s.py
mem usage: 70922240 Byte
mem usage: 100659200 Byte
```

## 1.44 Using annotation for type hints

```
#!/usr/bin/env python3

# need python3.5 or above (PEP: 484, 526, 3107)

from functools import wraps

from typing import (
    Dict,
    Tuple,
    List,
    Set,
    Generator,
    Type,
    TypeVar
)

# use annotation to do type hints (without type check)
def func(n: int) -> int:
    return n

def func(s: str) -> str:
    return s

def func(d: Dict) -> Dict:
```

(continues on next page)

(continued from previous page)

```

    return d

def func(l: List) -> List:
    return l

def func(t: Tuple) -> Tuple:
    return t

def func(s: Set) -> Set:
    return s

def func(g: Generator) -> Generator:
    return g

class C(object):
    pass

TC = TypeVar('C', bound=C)

def func(cls: Type) -> TC:
    print("cls is Type? ", isinstance(cls, Type))
    return cls()

# Based on TypeVar document, isinstance() and issubclass()
# should not be used with types. Thus, we us type(c) is C
# to check the type of instance
c = func(C)
print("return the instance of class C? ", type(c) is C)

```

## 1.45 Using annotation to check type

```

# need python3 (PEP: 3107)
from functools import wraps

import inspect

ANNO_EMPTY = inspect._empty

def check_args(sig, *a, **k):
    bind = sig.bind(*a, **k)
    params = sig.parameters
    for name, val in bind.arguments.items():
        anno = params[name].annotation
        if anno is ANNO_EMPTY:
            continue
        if isinstance(val, anno):
            continue
        atype = type(val)
        raise TypeError(f"type({name}) is '{anno}', not '{atype}'")

def check_ret(sig, ret):
    anno = sig.return_annotation
    if anno is ANNO_EMPTY:

```

(continues on next page)

```
        return ret
    elif isinstance(ret, anno):
        return ret

    rtype = type(ret)
    raise TypeError(f"type(ret) is '{anno}', not '{rtype}'")

def typechecked(func):
    sig = inspect.signature(func)

    @wraps(func)
    def wrapper(*a, **k):
        check_args(sig, *a, **k)
        return check_ret(sig, func(*a, **k))
    return wrapper

@typechecked
def test1(a: int)->int:
    return a

@typechecked
def test2(a: int):
    return a

@typechecked
def test3(a)->str:
    return a

@typechecked
def test4(a, b: str, c: str="c")->list:
    return [a, b, c]

print(test1(9527))
print(test2(9487))
print(test3("Hello Python3"))
print(test4(9487, "bb", c="cc"))

try:
    print(test3(9487))
except TypeError as e:
    print(e)

try:
    print(test4(5566, 9527))
except TypeError as e:
    print(e)

try:
    print(test4(123, "b", c=5566))
except TypeError as e:
    print(e)
```

output:

```
9527
9487
Hello Python3
[9487, 'bb', 'cc']
type(ret) is '<class 'str'>', not '<class 'int'>'
type(b) is '<class 'str'>', not '<class 'int'>'
type(c) is '<class 'str'>', not '<class 'int'>'
```

## 2.1 print is a function

### New in Python 3.0

- PEP 3105 - Make print a function

#### Python 2

```
>>> print "print is a statement"
print is a statement
>>> for x in range(3):
...     print x,
...
0 1 2
```

#### Python 3

```
>>> print("print is a function")
print is a function
>>> print()
>>> for x in range(3):
...     print(x, end=' ')
... else:
...     print()
...
0 1 2
```

## 2.2 String is unicode

### New in Python 3.0

- PEP 3138 - String representation in Python 3000
- PEP 3120 - Using UTF-8 as the default source encoding
- PEP 3131 - Supporting Non-ASCII Identifiers

#### Python 2

```
>>> s = 'Café' # byte string
>>> s
'Caf\xc3\xa9'
>>> type(s)
<type 'str'>
>>> u = u'Café' # unicode string
>>> u
```

(continues on next page)

(continued from previous page)

```
u'Caf\xe9'  
>>> type(u)  
<type 'unicode'>  
>>> len([_c for _c in 'Café'])  
5
```

### Python 3

```
>>> s = 'Café'  
>>> s  
'Café'  
>>> type(s)  
<class 'str'>  
>>> s.encode('utf-8')  
b'Caf\xc3\xa9'  
>>> s.encode('utf-8').decode('utf-8')  
'Café'  
>>> len([_c for _c in 'Café'])  
4
```

## 2.3 Division Operator

### New in Python 3.0

- [PEP 238](#) - Changing the Division Operator

### Python2

```
>>> 1 / 2  
0  
>>> 1 // 2  
0  
>>> 1. / 2  
0.5  
  
# back port "true division" to python2  
  
>>> from __future__ import division  
>>> 1 / 2  
0.5  
>>> 1 // 2  
0
```

### Python3

```
>>> 1 / 2  
0.5  
>>> 1 // 2  
0
```

## 2.4 Keyword-Only Arguments

### New in Python 3.0

- PEP 3102 - Keyword-Only Arguments

```
>>> def f(a, b, *, kw):
...     print(a, b, kw)
...
>>> f(1, 2, 3)
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
TypeError: f() takes 2 positional arguments but 3 were given
>>> f(1, 2)
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
TypeError: f() missing 1 required keyword-only argument: 'kw'
>>> f(1, 2, kw=3)
1 2 3
```

## 2.5 New Super

### New in Python 3.0

- PEP 3135 - New Super

#### Python 2

```
>>> class ParentCls(object):
...     def foo(self):
...         print "call parent"
...
>>> class ChildCls(ParentCls):
...     def foo(self):
...         super(ChildCls, self).foo()
...         print "call child"
...
>>> p = ParentCls()
>>> c = ChildCls()
>>> p.foo()
call parent
>>> c.foo()
call parent
call child
```

#### Python 3

```
>>> class ParentCls(object):
...     def foo(self):
...         print("call parent")
...
>>> class ChildCls(ParentCls):
...     def foo(self):
...         super().foo()
...         print("call child")
...
>>> p = ParentCls()
>>> c = ChildCls()
>>> p.foo()
call parent
```

(continues on next page)

(continued from previous page)

```
>>> c.foo()
call parent
call child
```

## 2.6 Remove <>

### New in Python 3.0

#### Python 2

```
>>> a = "Python2"
>>> a <> "Python3"
True

# equal to !=
>>> a != "Python3"
True
```

#### Python 3

```
>>> a = "Python3"
>>> a != "Python2"
True
```

## 2.7 Not allow from module import \* inside function

### New in Python 3.0

```
>>> def f():
...     from os import *
...
File "<stdin>", line 1
SyntaxError: import * only allowed at module level
```

## 2.8 Add nonlocal keyword

### New in Python 3.0

PEP 3104 - Access to Names in Outer Scopes

---

**Note:** nonlocal allow assigning directly to a variable in an outer (but non-global) scope

---

```
>>> def outf():
...     o = "out"
...     def inf():
...         nonlocal o
...         o = "change out"
...     inf()
```

(continues on next page)

(continued from previous page)

```
...     print(o)
...
>>> outf()
change out
```

## 2.9 Extended iterable unpacking

### New in Python 3.0

- PEP 3132 - Extended Iterable Unpacking

```
>>> a, *b, c = range(5)
>>> a, b, c
(0, [1, 2, 3], 4)
>>> for a, *b in [(1, 2, 3), (4, 5, 6, 7)]:
...     print(a, b)
...
1 [2, 3]
4 [5, 6, 7]
```

## 2.10 General unpacking

### New in Python 3.5

- PEP 448 - Additional Unpacking Generalizations

#### Python 2

```
>>> def func(*a, **k):
...     print(a)
...     print(k)
...
>>> func(*[1,2,3,4,5], **{"foo": "bar"})
(1, 2, 3, 4, 5)
{'foo': 'bar'}
```

#### Python 3

```
>>> print(*[1, 2, 3], 4, *[5, 6])
1 2 3 4 5 6
>>> [*range(4), 4]
[0, 1, 2, 3, 4]
>>> {"foo": "Foo", "bar": "Bar", **{"baz": "baz"}}
{'foo': 'Foo', 'bar': 'Bar', 'baz': 'baz'}
>>> def func(*a, **k):
...     print(a)
...     print(k)
...
>>> func(*[1], *[4,5], **{"foo": "FOO"}, **{"bar": "BAR"})
(1, 4, 5)
{'foo': 'FOO', 'bar': 'BAR'}
```

## 2.11 Function annotations

### New in Python 3.0

- PEP 3107 - Function Annotations
- PEP 484 - Type Hints
- PEP 483 - The Theory of Type Hints

```
>>> import types
>>> generator = types.GeneratorType
>>> def fib(n: int) -> generator:
...     a, b = 0, 1
...     for _ in range(n):
...         yield a
...         b, a = a + b, b
...
>>> [f for f in fib(10)]
[0, 1, 1, 2, 3, 5, 8, 13, 21, 34]
```

## 2.12 Variable annotations

### New in Python 3.6

- PEP 526 - Syntax for Variable Annotations

```
>>> from typing import List
>>> x: List[int] = [1, 2, 3]
>>> x
[1, 2, 3]

>>> from typing import List, Dict
>>> class Cls(object):
...     x: List[int] = [1, 2, 3]
...     y: Dict[str, str] = {"foo": "bar"}
...
>>> o = Cls()
>>> o.x
[1, 2, 3]
>>> o.y
{'foo': 'bar'}
```

## 2.13 Core support for typing module and generic types

### New in Python 3.7

- PEP 560 - Core support for typing module and generic types

Before Python 3.7

```
>>> from typing import Generic, TypeVar
>>> from typing import Iterable
>>> T = TypeVar('T')
```

(continues on next page)

(continued from previous page)

```

>>> class C(Generic[T]): ...
...
>>> def func(l: Iterable[C[int]]) -> None:
...     for i in l:
...         print(i)
...
>>> func([1,2,3])
1
2
3

```

Python 3.7 or above

```

>>> from typing import Iterable
>>> class C:
...     def __class_getitem__(cls, item):
...         return f"{cls.__name__}[{item.__name__}]"
...
>>> def func(l: Iterable[C[int]]) -> None:
...     for i in l:
...         print(i)
...
>>> func([1,2,3])
1
2
3

```

## 2.14 Format byte string

### New in Python 3.5

- PEP 461 - Adding % formatting to bytes and bytearray

```

>>> b'abc %b %b' % (b'foo', b'bar')
b'abc foo bar'
>>> b'%d %f' % (1, 3.14)
b'1 3.140000'
>>> class Cls(object):
...     def __repr__(self):
...         return "repr"
...     def __str__(self):
...         return "str"
...
'repr'
>>> b'%a' % Cls()
b'repr'

```

## 2.15 fstring

### New in Python 3.6

- PEP 498 - Literal String Interpolation

```

>>> py = "Python3"
>>> f'Awesome {py}'
'Awesome Python3'
>>> x = [1, 2, 3, 4, 5]
>>> f'{x}'
'[1, 2, 3, 4, 5]'
>>> def foo(x:int) -> int:
...     return x + 1
...
>>> f'{foo(0)}'
'1'
>>> f'{123.567:1.3}'
'1.24e+02'

```

## 2.16 Suppressing exception

### New in Python 3.3

- PEP 409 - Suppressing exception context

Without raise Exception from None

```

>>> def func():
...     try:
...         1 / 0
...     except ZeroDivisionError:
...         raise ArithmeticError
...
>>> func()
Traceback (most recent call last):
  File "<stdin>", line 3, in func
ZeroDivisionError: division by zero

```

During handling of the above exception, another exception occurred:

```

Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "<stdin>", line 5, in func
ArithmeticError

```

With raise Exception from None

```

>>> def func():
...     try:
...         1 / 0
...     except ZeroDivisionError:
...         raise ArithmeticError from None
...
>>> func()
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "<stdin>", line 5, in func
ArithmeticError

# debug

```

(continues on next page)

(continued from previous page)

```
>>> try:
...     func()
... except ArithmeticError as e:
...     print(e.__context__)
...
...
division by zero
```

## 2.17 Generator delegation

### New in Python 3.3

- PEP 380 - Syntax for Delegating to a Subgenerator

```
>>> def fib(n: int):
...     a, b = 0, 1
...     for _ in range(n):
...         yield a
...         b, a = a + b, b
...
...
>>> def delegate(n: int):
...     yield from fib(n)
...
...
>>> list(delegate(10))
[0, 1, 1, 2, 3, 5, 8, 13, 21, 34]
```

## 2.18 async and await syntax

### New in Python 3.5

- PEP 492 - Coroutines with async and await syntax

Before Python 3.5

```
>>> import asyncio
>>> @asyncio.coroutine
... def fib(n: int):
...     a, b = 0, 1
...     for _ in range(n):
...         b, a = a + b, b
...     return a
...
...
>>> @asyncio.coroutine
... def coro(n: int):
...     for x in range(n):
...         yield from asyncio.sleep(1)
...         f = yield from fib(x)
...         print(f)
...
...
>>> loop = asyncio.get_event_loop()
>>> loop.run_until_complete(coro(3))
0
```

(continues on next page)

(continued from previous page)

```
1
1
```

Python 3.5 or above

```
>>> import asyncio
>>> async def fib(n: int):
...     a, b = 0, 1
...     for _ in range(n):
...         b, a = a + b, b
...     return a
...
>>> async def coro(n: int):
...     for x in range(n):
...         await asyncio.sleep(1)
...         f = await fib(x)
...         print(f)
...
>>> loop = asyncio.get_event_loop()
>>> loop.run_until_complete(coro(3))
0
1
1
```

## 2.19 Asynchronous generators

New in Python 3.6

- [PEP 525](#) - Asynchronous Generators

```
>>> import asyncio
>>> async def fib(n: int):
...     a, b = 0, 1
...     for _ in range(n):
...         await asyncio.sleep(1)
...         yield a
...         b, a = a + b, b
...
>>> async def coro(n: int):
...     ag = fib(n)
...     f = await ag.asend(None)
...     print(f)
...     f = await ag.asend(None)
...     print(f)
...
>>> loop = asyncio.get_event_loop()
>>> loop.run_until_complete(coro(5))
0
1
```

## 2.20 Asynchronous comprehensions

New in Python 3.6

- PEP 530 - Asynchronous Comprehensions

```

>>> import asyncio
>>> async def fib(n: int):
...     a, b = 0, 1
...     for _ in range(n):
...         await asyncio.sleep(1)
...         yield a
...         b, a = a + b, b
...

# async for ... else

>>> async def coro(n: int):
...     async for f in fib(n):
...         print(f, end=" ")
...     else:
...         print()
...

>>> loop = asyncio.get_event_loop()
>>> loop.run_until_complete(coro(5))
0 1 1 2 3

# async for in list

>>> async def coro(n: int):
...     return [f async for f in fib(n)]
...

>>> loop.run_until_complete(coro(5))
[0, 1, 1, 2, 3]

# await in list

>>> async def slowfmt(n: int) -> str:
...     await asyncio.sleep(0.5)
...     return f'{n}'
...

>>> async def coro(n: int):
...     return [await slowfmt(f) async for f in fib(n)]
...

>>> loop.run_until_complete(coro(5))
['0', '1', '1', '2', '3']

```

## 2.21 Matrix multiplication

### New in Python 3.5

- PEP 465 - A dedicated infix operator for matrix multiplication

```

>>> # "@" represent matrix multiplication
>>> class Arr:
...     def __init__(self, *arg):
...         self._arr = arg
...     def __matmul__(self, other):
...         if not isinstance(other, Arr):
...             raise TypeError

```

(continues on next page)

(continued from previous page)

```

...     if len(self) != len(other):
...         raise ValueError
...     return sum([x*y for x, y in zip(self._arr, other._arr)])
...     def __imatmul__(self, other):
...         if not isinstance(other, Arr):
...             raise TypeError
...         if len(self) != len(other):
...             raise ValueError
...         res = sum([x*y for x, y in zip(self._arr, other._arr)])
...         self._arr = [res]
...         return self
...     def __len__(self):
...         return len(self._arr)
...     def __str__(self):
...         return self.__repr__()
...     def __repr__(self):
...         return "Arr({})".format(repr(self._arr))
...
>>> a = Arr(9, 5, 2, 7)
>>> b = Arr(5, 5, 6, 6)
>>> a @ b # __matmul__
124
>>> a @= b # __imatmul__
>>> a
Arr([124])

```

## 2.22 Data Classes

### New in Python 3.7

PEP 557 - Data Classes

Mutable Data Class

```

>>> from dataclasses import dataclass
>>> @dataclass
... class DCls(object):
...     x: str
...     y: str
...
>>> d = DCls("foo", "bar")
>>> d
DCls(x='foo', y='bar')
>>> d = DCls(x="foo", y="baz")
>>> d
DCls(x='foo', y='baz')
>>> d.z = "bar"

```

Immutable Data Class

```

>>> from dataclasses import dataclass
>>> from dataclasses import FrozenInstanceError
>>> @dataclass(frozen=True)
... class DCls(object):
...     x: str

```

(continues on next page)

(continued from previous page)

```
...     y: str
...
>>> try:
...     d.x = "baz"
... except FrozenInstanceError as e:
...     print(e)
...
cannot assign to field 'x'
>>> try:
...     d.z = "baz"
... except FrozenInstanceError as e:
...     print(e)
...
cannot assign to field 'z'
```

## 2.23 Built-in breakpoint ()

### New in Python 3.7

- [PEP 553](#) - Built-in breakpoint()

```
>>> for x in range(3):
...     print(x)
...     breakpoint()
...
0
> <stdin>(1)<module>()->None
(Pdb) c
1
> <stdin>(1)<module>()->None
(Pdb) c
2
> <stdin>(1)<module>()->None
(Pdb) c
```

### Table of Contents

  - *python3 str is equivalent to unicode string*
  - *python2 take str char as byte character*
  - *python3 take str char as unicode character*
  - *unicode normalization*

### 3.1 Encode: unicode code point to bytes

```
>>> s = u'Café'  
>>> type(s.encode('utf-8'))  
<class 'bytes'>
```

### 3.2 Decode: bytes to unicode code point

```
>>> s = bytes('Café', encoding='utf-8')
>>> s.decode('utf-8')
'Café'
```

### 3.3 Get unicode code point

```
>>> s = u'Café'
>>> for _c in s: print('U+%04x' % ord(_c))
...
U+0043
U+0061
U+0066
U+00e9
>>> u = ''
>>> for _c in u: print('U+%04x' % ord(_c))
...
U+4e2d
U+6587
```

### 3.4 python2 str is equivalent to byte string

```
>>> s = 'Café' # byte string
>>> s
'Caf\xc3\xa9'
>>> type(s)
<type 'str'>
>>> u = u'Café' # unicode string
>>> u
u'Caf\xe9'
>>> type(u)
<type 'unicode'>
```

### 3.5 python3 str is equivalent to unicode string

```
>>> s = 'Café'
>>> type(s)
<class 'str'>
>>> s
'Café'
>>> s.encode('utf-8')
b'Caf\xc3\xa9'
>>> s.encode('utf-8').decode('utf-8')
'Café'
```

### 3.6 python2 take str char as byte character

```
>>> s= 'Café'
>>> print [_c for _c in s]
['C', 'a', 'f', '\xc3', '\xa9']
>>> len(s)
5
>>> s = u'Café'
>>> print [_c for _c in s]
[u'C', u'a', u'f', u'\xe9']
>>> len(s)
4
```

### 3.7 python3 take str char as unicode character

```
>>> s = 'Café'
>>> print([_c for _c in s])
['C', 'a', 'f', 'é']
>>> len(s)
4
>>> bs = bytes(s, encoding='utf-8')
>>> print(bs)
b'Caf\xc3\xa9'
>>> len(bs)
5
```

### 3.8 unicode normalization

```
# python 3
>>> u1 = 'Café'          # unicode string
>>> u2 = 'Cafe\u0301'
>>> u1, u2
('Café', 'Cafe')
>>> len(u1), len(u2)
(4, 5)
>>> u1 == u2
False
>>> u1.encode('utf-8') # get u1 byte string
b'Caf\xc3\xa9'
>>> u2.encode('utf-8') # get u2 byte string
b'Cafe\xc3\x01'
>>> from unicodedata import normalize
>>> s1 = normalize('NFC', u1) # get u1 NFC format
>>> s2 = normalize('NFC', u2) # get u2 NFC format
>>> s1 == s2
True
>>> s1.encode('utf-8'), s2.encode('utf-8')
(b'Caf\xc3\xa9', b'Caf\xc3\xa9')
>>> s1 = normalize('NFD', u1) # get u1 NFD format
>>> s2 = normalize('NFD', u2) # get u2 NFD format
>>> s1, s2
```

(continues on next page)

(continued from previous page)

```
('Cafe', 'Cafe')
>>> s1 == s2
True
>>> s1.encode('utf-8'), s2.encode('utf-8')
(b'Cafe\xcc\x81', b'Cafe\xcc\x81')
```

## 4.1 Glossary of Generator

```
# generator function
>>> def gen_func():
...     yield 5566
...
>>> gen_func
<function gen_func at 0x1019273a>

# generator
#
# calling the generator function returns a generator

>>> g = gen_func()
>>> g
<generator object gen_func at 0x101238fd>
>>> next(g)
5566
>>> next(g)
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
StopIteration

# generator expression
#
# generator expression evaluating directly to a generator

>>> g = (x for x in range(2))
>>> g
<generator object <genexpr> at 0x10a9c191>
>>> next(g)
0
>>> next(g)
1
>>> next(g)
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
```

(continues on next page)

(continued from previous page)

```
StopIteration
```

## 4.2 Produce value via generator

```
>>> from __future__ import print_function
>>> def prime(n):
...     p = 2
...     while n > 0:
...         for x in range(2, p):
...             if p % x == 0:
...                 break
...             else:
...                 yield p
...                 n -= 1
...         p += 1
...
>>> p = prime(3)
>>> next(p)
2
>>> next(p)
3
>>> next(p)
5
>>> next(p)
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
StopIteration
>>> for x in prime(5):
...     print(x, end=" ")
...
2 3 5 7 11 >>>
```

## 4.3 Unpacking Generators

```
# PEP 448

# unpacking inside a list

>>> g1 = (x for x in range(3))
>>> g2 = (x**2 for x in range(2))
>>> [1, *g1, 2, *g2]
[1, 0, 1, 2, 2, 0, 1]
>>> # equal to
>>> g1 = (x for x in range(3))
>>> g2 = (x**2 for x in range(2))
>>> [1] + list(g1) + [2] + list(g2)
[1, 0, 1, 2, 2, 0, 1]

# unpacking inside a set

>>> g = (x for x in [5, 5, 6, 6])
```

(continues on next page)

(continued from previous page)

```

>>> {*g}
{5, 6}

# unpacking to variables

>>> g = (x for x in range(3))
>>> a, b, c = g
>>> print(a, b, c)
0 1 2
>>> g = (x for x in range(6))
>>> a, b, *c, d = g
>>> print(a, b, d)
0 1 5
>>> print(c)
[2, 3, 4]

# unpacking inside a function

>>> print(*(x for x in range(3)))
0 1 2

```

## 4.4 Implement Iterable object via generator

```

>>> from __future__ import print_function
>>> class Count(object):
...     def __init__(self, n):
...         self._n = n
...     def __iter__(self):
...         n = self._n
...         while n > 0:
...             yield n
...             n -= 1
...     def __reversed__(self):
...         n = 1
...         while n <= self._n:
...             yield n
...             n += 1
...
>>> for x in Count(5):
...     print(x, end=" ")
...
5 4 3 2 1 >>>
>>> for x in reversed(Count(5)):
...     print(x, end=" ")
...
1 2 3 4 5 >>>

```

## 4.5 Send message to generator

```

>>> def spam():
...     msg = yield

```

(continues on next page)

(continued from previous page)

```
...     print("Message:", msg)
...
>>> try:
...     g = spam()
...     # start generator
...     next(g)
...     # send message to generator
...     g.send("Hello World!")
... except StopIteration:
...     pass
...
Message: Hello World!
```

## 4.6 yield from expression

```
# delegating gen do nothing(pipe)
>>> def subgen():
...     try:
...         yield 9527
...     except ValueError:
...         print("get value error")
...
>>> def delegating_gen():
...     yield from subgen()
...
>>> g = delegating_gen()
>>> try:
...     next(g)
...     g.throw(ValueError)
... except StopIteration:
...     print("gen stop")
...
9527
get value error
gen stop

# yield from + yield from
>>> import inspect
>>> def subgen():
...     yield from range(5)
...
>>> def delegating_gen():
...     yield from subgen()
...
>>> g = delegating_gen()
>>> inspect.getgeneratorstate(g)
'GEN_CREATED'
>>> next(g)
0
>>> inspect.getgeneratorstate(g)
'GEN_SUSPENDED'
>>> g.close()
>>> inspect.getgeneratorstate(g)
'GEN_CLOSED'
```

## 4.7 yield (from) EXPR return RES

```

>>> def average():
...     total = .0
...     count = 0
...     avg = None
...     while True:
...         val = yield
...         if not val:
...             break
...         total += val
...         count += 1
...         avg = total / count
...     return avg
...
>>> g = average()
>>> next(g) # start gen
>>> g.send(3)
>>> g.send(5)
>>> try:
...     g.send(None)
... except StopIteration as e:
...     ret = e.value
...
>>> ret
4.0

# yield from EXP return RES
>>> def subgen():
...     yield 9527
...
>>> def delegating_gen():
...     yield from subgen()
...     return 5566
...
>>> try:
...     g = delegating_gen()
...     next(g)
...     next(g)
... except StopIteration as _e:
...     print(_e.value)
...
9527
5566

```

## 4.8 Generate sequences

```

# get a list via generator

>>> def chain():
...     for x in 'ab':
...         yield x
...     for x in range(3):
...         yield x

```

(continues on next page)

(continued from previous page)

```
...
>>> a = list(chain())
>>> a
['a', 'b', 0, 1, 2]

# equivalent to

>>> def chain():
...     yield from 'ab'
...     yield from range(3)
...
>>> a = list(chain())
>>> a
['a', 'b', 0, 1, 2]
```

## 4.9 What RES = yield from EXP actually do?

```
# ref: pep380
>>> def subgen():
...     for x in range(3):
...         yield x
...
>>> EXP = subgen()
>>> def delegating_gen():
...     _i = iter(EXP)
...     try:
...         _y = next(_i)
...     except StopIteration as _e:
...         RES = _e.value
...     else:
...         while True:
...             _s = yield _y
...             try:
...                 _y = _i.send(_s)
...             except StopIteration as _e:
...                 RES = _e.value
...                 break
...
>>> g = delegating_gen()
>>> next(g)
0
>>> next(g)
1
>>> next(g)
2

# equivalent to
>>> EXP = subgen()
>>> def delegating_gen():
...     RES = yield from EXP
...
>>> g = delegating_gen()
>>> next(g)
0
```

(continues on next page)

(continued from previous page)

```
>>> next(g)
1
```

## 4.10 for \_ in gen() simulate yield from

```
>>> def subgen(n):
...     for x in range(n): yield x
...
>>> def gen(n):
...     yield from subgen(n)
...
>>> g = gen(3)
>>> next(g)
0
>>> next(g)
1

# equal to

>>> def gen(n):
...     for x in subgen(n): yield x
...
>>> g = gen(3)
>>> next(g)
0
>>> next(g)
1
```

## 4.11 Check generator type

```
>>> from types import GeneratorType
>>> def gen_func():
...     yield 5566
...
>>> g = gen_func()
>>> isinstance(g, GeneratorType)
True
>>> isinstance(123, GeneratorType)
False
```

## 4.12 Check Generator State

```
>>> import inspect
>>> def gen_func():
...     yield 9527
...
>>> g = gen_func()
>>> inspect.getgeneratorstate(g)
```

(continues on next page)

(continued from previous page)

```
'GEN_CREATED'
>>> next(g)
9527
>>> inspect.getgeneratorstate(g)
'GEN_SUSPENDED'
>>> g.close()
>>> inspect.getgeneratorstate(g)
'GEN_CLOSED'
```

## 4.13 Simple compiler

```
# David Beazley - Generators: The Final Frontier

import re
import types
from collections import namedtuple

tokens = [
    r'(?P<NUMBER>\d+)',
    r'(?P<PLUS>\+)',
    r'(?P<MINUS>-)',
    r'(?P<TIMES>\*)',
    r'(?P<DIVIDE>/)',
    r'(?P<WS>\s+)'
]

Token = namedtuple('Token', ['type', 'value'])
lex = re.compile('|'.join(tokens))

def tokenize(text):
    scan = lex.scanner(text)
    gen = (Token(m.lastgroup, m.group())
           for m in iter(scan.match, None) if m.lastgroup != 'WS')
    return gen

class Node:
    _fields = []
    def __init__(self, *args):
        for attr, value in zip(self._fields, args):

## 5.1 Compare HTML tags

| tag type   | format      | example      |
|------------|-------------|--------------|
| all tag    | <[^>]+>     | <br />, <a>  |
| open tag   | <[^>][^>]*> | <a>, <table> |
| close tag  | </[^>]+>    | </p>, </a>   |
| self close | <[^>]+/>    | <br />       |

```
# open tag
>>> re.search('<[^>][^>]*>', '<table>') != None
True
>>> re.search('<[^>][^>]*>', '<a href="#label">') != None
True
>>> re.search('<[^>][^>]*>', '') != None
True
>>> re.search('<[^>][^>]*>', '</table>') != None
False

# close tag
>>> re.search('</[^>]+>', '</table>') != None
True

# self close
>>> re.search('<[^>]+/>', '<br />') != None
True
```

## 5.2 re.findall() match string

```
# split all string
>>> source = "Hello World Ker HAHA"
>>> re.findall('[\w]+', source)
['Hello', 'World', 'Ker', 'HAHA']

# parsing python.org website
>>> import urllib
>>> import re
>>> s = urllib.urlopen('https://www.python.org')
>>> html = s.read()
>>> s.close()
>>> print "open tags"
open tags
>>> re.findall('<[^>][^>]*>', html)[0:2]
['<!doctype html>', '<!--[if lt IE 7]>']
>>> print "close tags"
close tags
>>> re.findall('</[^>]+>', html)[0:2]
['</script>', '</title>']
>>> print "self-closing tags"
```

## 5.3 Group Comparison

```
# (...) group a regular expression
>>> m = re.search(r'(\d{4})-(\d{2})-(\d{2})', '2016-01-01')
>>> m
<_sre.SRE_Match object; span=(0, 10), match='2016-01-01'>
>>> m.groups()
('2016', '01', '01')
>>> m.group()
'2016-01-01'
>>> m.group(1)
'2016'
>>> m.group(2)
'01'
>>> m.group(3)
'01'

# Nesting groups
>>> m = re.search(r'((\d{4})-\d{2})-\d{2}', '2016-01-01')
>>> m.groups()
('2016-01-01', '2016-01', '2016')
>>> m.group()
'2016-01-01'
>>> m.group(1)
'2016-01-01'
>>> m.group(2)
'2016-01'
>>> m.group(3)
'2016'
```

## 5.4 Non capturing group

```
# non capturing group
>>> url = 'http://stackoverflow.com/'
>>> m = re.search('(?:http|ftp)://([^\r\n]+)(/[^\r\n]*)?', url)
>>> m.groups()
('stackoverflow.com', '/')

# capturing group
>>> m = re.search('(http|ftp)://([^\r\n]+)(/[^\r\n]*)?', url)
>>> m.groups()
('http', 'stackoverflow.com', '/')
```

## 5.5 Back Reference

```
# compare 'aa', 'bb'
>>> re.search(r'([a-z])\1$', 'aa') != None
True
>>> re.search(r'([a-z])\1$', 'bb') != None
True
>>> re.search(r'([a-z])\1$', 'ab') != None
```

(continues on next page)

(continued from previous page)

```
False

# compare open tag and close tag
>>> pattern = r'<([^\>]+)>[\s\S]*?</\1>'
>>> re.search(pattern, '<bold> test </bold>') != None
True
>>> re.search(pattern, '<h1> test </h1>') != None
True
>>> re.search(pattern, '<bold> test </h1>') != None
False
```

## 5.6 Named Grouping (?P<name>)

```
# group reference ``(?P<name>...)``
>>> pattern = '(?P<year>\d{4})-(?P<month>\d{2})-(?P<day>\d{2})'
>>> m = re.search(pattern, '2016-01-01')
>>> m.group('year')
'2016'
>>> m.group('month')
'01'
>>> m.group('day')
'01'

# back reference ``(?P=name)``
>>> re.search('^(?P<char>[a-z])(?P=char)', 'aa')
<_sre.SRE_Match object at 0x10ae0f288>
```

## 5.7 Substitute String

```
# basic substitute
>>> res = "1a2b3c"
>>> re.sub(r'[a-z]', ' ', res)
'1 2 3 '

# substitute with group reference
>>> date = r'2016-01-01'
>>> re.sub(r'(\d{4})-(\d{2})-(\d{2})', r'\2/\3/\1/', date)
'01/01/2016/'

# camelcase to underscore
>>> def convert(s):
...     res = re.sub(r'([A-Z][a-z]+)', r'\1_\2', s)
...     return re.sub(r'([a-z])([A-Z])', r'\1_\2', res).lower()
...
>>> convert('CamelCase')
'camel_case'
>>> convert('CamelCamelCase')
'camel_camel_case'
>>> convert('SimpleHTTPServer')
'simple_http_server'
```

## 5.8 Look around

| notation | compare direction |
|----------|-------------------|
| (?=...)  | left to right     |
| (?!...)  | left to right     |
| (?<=...) | right to left     |
| (?!<...) | right to left     |

```
# basic
>>> re.sub('(?=\d{3})', ' ', '12345')
' 1 2 345'
>>> re.sub('(?!\d{3})', ' ', '12345')
'123 4 5 '
>>> re.sub('(?<=\d{3})', ' ', '12345')
'123 4 5 '
>>> re.sub('(?!<\d{3})', ' ', '12345')
' 1 2 345'
```

## 5.9 Match common username or password

```
>>> re.match('^[a-zA-Z0-9-_{3,16}$', 'Foo') is not None
True
>>> re.match('^\w|[-_{3,16}$', 'Foo') is not None
True
```

## 5.10 Match hex color value

```
>>> re.match('^#?([a-f0-9]{6}|[a-f0-9]{3})$', '#ffffff')
<_sre.SRE_Match object at 0x10886f6c0>
>>> re.match('^#?([a-f0-9]{6}|[a-f0-9]{3})$', '#ffffffh')
<_sre.SRE_Match object at 0x10886f288>
```

## 5.11 Match email

```
>>> re.match('^([a-z0-9\.-]+)@([\da-z\.-]+)\.([a-z\.-]{2,6})$',
...         'hello.world@example.com')
<_sre.SRE_Match object at 0x1087a4d40>

# or

>>> exp = re.compile(r'^([a-zA-Z0-9._%-]+@
...                 [a-zA-Z0-9.-]+
...                 \.[a-zA-Z]{2,4})*$', re.X)
>>> exp.match('hello.world@example.hello.com')
<_sre.SRE_Match object at 0x1083efd50>
>>> exp.match('hello%world@example.hello.com')
<_sre.SRE_Match object at 0x1083efeb8>
```

## 5.12 Match URL

```
>>> exp = re.compile(r'''^(https?:\\\/)? # match http or https
...                 ([\da-z\.-]+)      # match domain
...                 \.([a-z\.] {2,6})  # match domain
...                 ([\\\/w \.-]*)\\\/?$ # match api or file
...                 ''', re.X)
>>>
>>> exp.match('www.google.com')
<_sre.SRE_Match object at 0x10f01ddf8>
>>> exp.match('http://www.example')
<_sre.SRE_Match object at 0x10f01dd50>
>>> exp.match('http://www.example/file.html')
<_sre.SRE_Match object at 0x10f01ddf8>
>>> exp.match('http://www.example/file!.html')
```

## 5.13 Match IP address

| notation       | description           |
|----------------|-----------------------|
| (?:...)        | Don't capture group   |
| 25[0-5]        | Match 251-255 pattern |
| 2[0-4][0-9]    | Match 200-249 pattern |
| [1]?[0-9][0-9] | Match 0-199 pattern   |

```
>>> exp = re.compile(r'''^(?:(?:25[0-5]
...                 |2[0-4][0-9]
...                 | [1]?[0-9][0-9]?)\.) {3}
...                 (?:25[0-5]
...                 |2[0-4][0-9]
...                 | [1]?[0-9][0-9]?)$''', re.X)
>>> exp.match('192.168.1.1')
<_sre.SRE_Match object at 0x108f47ac0>
>>> exp.match('255.255.255.0')
<_sre.SRE_Match object at 0x108f47b28>
>>> exp.match('172.17.0.5')
<_sre.SRE_Match object at 0x108f47ac0>
>>> exp.match('256.0.0.0') is None
True
```

## 5.14 Match Mac address

```
>>> import random
>>> mac = [random.randint(0x00, 0x7f),
...       random.randint(0x00, 0x7f),
...       random.randint(0x00, 0x7f),
...       random.randint(0x00, 0x7f),
...       random.randint(0x00, 0x7f),
...       random.randint(0x00, 0x7f)]
>>> mac = ':'.join(map(lambda x: "%02x" % x, mac))
```

(continues on next page)

(continued from previous page)

```
>>> mac
'3c:38:51:05:03:1e'
>>> exp = re.compile(r'[0-9a-f]{2}([:])
...                 [0-9a-f]{2}
...                 (\1[0-9a-f]{2}){4}$', re.X)
>>> exp.match(mac) is not None
True
```

## 5.15 Lexer

```
>>> import re
>>> from collections import namedtuple
>>> tokens = [r'(?P<NUMBER>\d+)',
...          r'(?P<PLUS>\+)',
...          r'(?P<MINUS>-)',
...          r'(?P<TIMES>\*)',
...          r'(?P<DIVIDE>/)',
...          r'(?P<WS>\s+)']
>>> lex = re.compile('|'.join(tokens))
>>> Token = namedtuple('Token', ['type', 'value'])
>>> def tokenize(text):
...     scan = lex.scanner(text)
...     return (Token(m.lastgroup, m.group())
...             for m in iter(scan.match, None) if m.lastgroup != 'WS')
...
>>> for _t in tokenize('9 + 5 * 2 - 7'):
...     print(_t)
...
Token(type='NUMBER', value='9')
Token(type='PLUS', value='+')
Token(type='NUMBER', value='5')
Token(type='TIMES', value='*')
Token(type='NUMBER', value='2')
Token(type='MINUS', value='-')
Token(type='NUMBER', value='7')
```

## 6.1 Get Hostname

```
>>> import socket
>>> socket.gethostname()
'MacBookPro-4380.local'
>>> hostname = socket.gethostname()
>>> socket.gethostbyname(hostname)
'172.20.10.4'
>>> socket.gethostbyname('localhost')
'127.0.0.1'
```

## 6.2 Get address family and socket address from string

```
import socket
import sys

try:
    for res in socket.getaddrinfo(sys.argv[1], None,
                                  proto=socket.IPPROTO_TCP):
        family = res[0]
        sockaddr = res[4]
        print(family, sockaddr)
```

(continues on next page)

(continued from previous page)

```
except socket.gaierror:
    print("Invalid")
```

Output:

```
$ gai.py 192.0.2.244
AddressFamily.AF_INET ('192.0.2.244', 0)
$ gai.py 2001:db8:f00d::1:d
AddressFamily.AF_INET6 ('2001:db8:f00d::1:d', 0, 0, 0)
$ gai.py www.google.com
AddressFamily.AF_INET6 ('2607:f8b0:4006:818::2004', 0, 0, 0)
AddressFamily.AF_INET ('172.217.10.132', 0)
```

It handles unusual cases, valid and invalid:

```
$ gai.py 10.0.0.256 # octet overflow
Invalid
$ gai.py not-exist.example.com # unresolvable
Invalid
$ gai.py fe80::1%eth0 # scoped
AddressFamily.AF_INET6 ('fe80::1%eth0', 0, 0, 2)
$ gai.py ::ffff:192.0.2.128 # IPv4-Mapped
AddressFamily.AF_INET6 ('::ffff:192.0.2.128', 0, 0, 0)
$ gai.py 0xc000027b # IPv4 in hex
AddressFamily.AF_INET ('192.0.2.123', 0)
$ gai.py 3221226198 # IPv4 in decimal
AddressFamily.AF_INET ('192.0.2.214', 0)
```

## 6.3 Transform Host & Network Endian

```
# little-endian machine
>>> import socket
>>> a = 1 # host endian
>>> socket.htons(a) # network endian
256
>>> socket.htonl(a) # network endian
16777216
>>> socket.ntohs(256) # host endian
1
>>> socket.ntohl(16777216) # host endian
1

# big-endian machine
>>> import socket
>>> a = 1 # host endian
>>> socket.htons(a) # network endian
1
>>> socket.htonl(a) # network endian
1L
>>> socket.ntohs(1) # host endian
1
>>> socket.ntohl(1) # host endian
1L
```

## 6.4 IP dotted-quad string & byte format convert

```
>>> import socket
>>> addr = socket.inet_aton('127.0.0.1')
>>> addr
'\x7f\x00\x00\x01'
>>> socket.inet_ntoa(addr)
'127.0.0.1'
```

## 6.5 Mac address & byte format convert

```
>>> mac = '00:11:32:3c:c3:0b'
>>> byte = binascii.unhexlify(mac.replace(':', ''))
>>> byte
'\x00\x11<\xc3\x0b'
>>> binascii.hexlify(byte)
'0011323cc30b'
```

## 6.6 Simple TCP Echo Server

```
import socket

class Server(object):
    def __init__(self, host, port):
        self._host = host
        self._port = port
    def __enter__(self):
        sock = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
        sock.setsockopt(socket.SOL_SOCKET, socket.SO_REUSEADDR, 1)
        sock.bind((self._host, self._port))
        sock.listen(10)
        self._sock = sock
        return self._sock
    def __exit__(self, *exc_info):
        if exc_info[0]:
            import traceback
            traceback.print_exception(*exc_info)
        self._sock.close()

if __name__ == '__main__':
    host = 'localhost'
    port = 5566
    with Server(host, 5566) as s:
        while True:
            conn, addr = s.accept()
            msg = conn.recv(1024)
            conn.send(msg)
            conn.close()
```

output:

```
$ nc localhost 5566
Hello World
Hello World
```

## 6.7 Simple TCP Echo Server through IPv6

```
import contextlib
import socket

host = "::1"
port = 5566

@contextlib.contextmanager
def server(host, port):
    s = socket.socket(socket.AF_INET6, socket.SOCK_STREAM, 0)
    try:
        s.setsockopt(socket.SOL_SOCKET, socket.SO_REUSEADDR, 1)
        s.bind((host, port))
        s.listen(10)
        yield s
    finally:
        s.close()

with server(host, port) as s:

```

## 6.9 Simple TCP Echo Server Via SocketServer

```

>>> import SocketServer
>>> bh = SocketServer.BaseRequestHandler
>>> class handler(bh):

```

(continues on next page)

(continued from previous page)

```

...     def handle(self):
...         data = self.request.recv(1024)
...         print(self.client_address)
...         self.request.sendall(data)
...
>>> host = ('localhost',5566)
>>> s = SocketServer.TCPServer(
...     host, handler)
>>> s.serve_forever()

```

output:

```

$ nc localhost 5566
Hello World
Hello World

```

## 6.10 Simple TLS/SSL TCP Echo Server

```

import socket
import ssl

sock = socket.socket(socket.AF_INET, socket.SOCK_STREAM, 0)
sock.setsockopt(socket.SOL_SOCKET, socket.SO_REUSEADDR, 1)
sock.bind(('localhost', 5566))
sock.listen(10)

sslctx = ssl.SSLContext(ssl.PROTOCOL_TLSv1)
sslctx.load_cert_chain(certfile='./root-ca.crt',
                      keyfile='./root-ca.key')

try:
    while True:
        conn, addr = sock.accept()
        sslconn = sslctx.wrap_socket(conn, server_side=True)
        msg = sslconn.recv(1024)
        if msg:
            sslconn.send(msg)
        sslconn.close()
finally:
    sock.close()

```

output:

```

# console 1
$ openssl genrsa -out root-ca.key 2048
$ openssl req -x509 -new -nodes -key root-ca.key -days 365 -out root-ca.crt
$ python3 ssl_tcp_server.py

# console 2
$ openssl s_client -connect localhost:5566
...
Hello SSL
Hello SSL
read:errno=0

```

## 6.11 Set ciphers on TLS/SSL TCP Echo Server

```
import socket
import json
import ssl

sock = socket.socket(socket.AF_INET, socket.SOCK_STREAM, 0)
sock.setsockopt(socket.SOL_SOCKET, socket.SO_REUSEADDR, 1)
sock.bind(('localhost', 5566))
sock.listen(10)

sslctx = ssl.SSLContext(ssl.PROTOCOL_SSLv23)
sslctx.load_cert_chain(certfile='cert.pem',
                      keyfile='key.pem')

# set ssl ciphers
sslctx.set_ciphers('ECDH-ECDSA-AES128-GCM-SHA256')
print(json.dumps(sslctx.get_ciphers(), indent=2))

try:
    while True:
        conn, addr = sock.accept()
        sslconn = sslctx.wrap_socket(conn, server_side=True)
        msg = sslconn.recv(1024)
        if msg:
            sslconn.send(msg)
        sslconn.close()
finally:
    sock.close()
```

output:

You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
If you enter '.', the field will be left blank.

## 8.1 Execute a shell command

```
# get stdout, stderr, returncode
>>> from subprocess import Popen, PIPE
>>> args = ['time', 'echo', 'hello python']
>>> ret = Popen(args, stdout=PIPE, stderr=PIPE)
>>> out, err = ret.communicate()
>>> out
b'hello python\n'
>>> err
b'      0.00 real          0.00 user          0.00 sys\n'
>>> ret.returncode
0
```

## 8.2 Create a thread via “threading”

```
>>> from threading import Thread
>>> class Worker(Thread):
...     def __init__(self, id):
...         super(Worker, self).__init__()
...         self._id = id
...     def run(self):
...         print("I am worker %d" % self._id)
...
>>> t1 = Worker(1)
>>> t2 = Worker(2)
>>> t1.start(); t2.start()
I am worker 1
I am worker 2

# using function could be more flexible
>>> def Worker(worker_id):
...     print("I am worker %d" % worker_id)
...
>>> from threading import Thread
>>> t1 = Thread(target=Worker, args=(1,))
>>> t2 = Thread(target=Worker, args=(2,))
>>> t1.start()
I am worker 1
I am worker 2
```

## 8.3 Performance Problem - GIL

```

# GIL - Global Interpreter Lock
# see: Understanding the Python GIL
>>> from threading import Thread
>>> def profile(func):
...     def wrapper(*args, **kwargs):
...         import time
...         start = time.time()
...         func(*args, **kwargs)
...         end = time.time()
...         print(end - start)
...     return wrapper
...
>>> @profile
... def nothread():
...     fib(35)
...     fib(35)
...
>>> @profile
... def hasthread():
...     t1=Thread(target=fib, args=(35,))
...     t2=Thread(target=fib, args=(35,))
...     t1.start(); t2.start()
...     t1.join(); t2.join()
...
>>> nothread()
9.51164007187
>>> hasthread()
11.3131771088
# !Thread get bad Performance
# since cost on context switch

```

## 8.4 Consumer and Producer

```

# This architecture make concurrency easy
>>> from threading import Thread
>>> from Queue import Queue
>>> from random import random
>>> import time
>>> q = Queue()
>>> def fib(n):
...     if n<=2:
...         return 1
...     return fib(n-1)+fib(n-2)
...
>>> def producer():
...     while True:
...         wt = random()*5
...         time.sleep(wt)
...         q.put((fib,35))
...
>>> def consumer():
...     while True:

```

(continues on next page)

(continued from previous page)

```
...     task,arg = q.get()
...     print(task(arg))
...     q.task_done()
...
>>> t1 = Thread(target=producer)
>>> t2 = Thread(target=consumer)
>>> t1.start();t2.start()
```

## 8.5 Thread Pool Template

```
# producer and consumer architecture
from Queue import Queue
from threading import Thread

class Worker(Thread):
    def __init__(self,queue):
        super(Worker, self).__init__()
        self._q = queue
        self.daemon = True
        self.start()
    def run(self):
        while True:
            f,args,kwarg = self._q.get()
            try:
                print(f(*args, **kwarg))
            except Exception as e:
                print(e)
            self._q.task_done()

class ThreadPool(object):
    def __init__(self, num_t=5):
        self._q = Queue(num_t)
        # Create Worker Thread
        for _ in range(num_t):
            Worker(self._q)
    def add_task(self,f,*args,**kwarg):
        self._q.put((f, args, kwarg))
    def wait_complete(self):
        self._q.join()

def fib(n):
    if n <= 2:
        return 1
    return fib(n-1)+fib(n-2)

if __name__ == '__main__':
    pool = ThreadPool()
    for _ in range(3):
        pool.add_task(fib,35)
    pool.wait_complete()
```

## 8.6 Using multiprocessing ThreadPool

```
# ThreadPool is not in python doc
>>> from multiprocessing.pool import ThreadPool
>>> pool = ThreadPool(5)
>>> pool.map(lambda x: x**2, range(5))
[0, 1, 4, 9, 16]
```

Compare with “map” performance

```
# pool will get bad result since GIL
import time
from multiprocessing.pool import \
    ThreadPool

pool = ThreadPool(10)
def profile(func):
    def wrapper(*args, **kwargs):
        print(func.__name__)
        s = time.time()
        func(*args, **kwargs)
        e = time.time()
        print("cost: {}".format(e-s))
    return wrapper

@profile
def pool_map():
    res = pool.map(lambda x:x**2,
                  range(999999))

@profile
def ordinary_map():
    res = map(lambda x:x**2,
             range(999999))

pool_map()
ordinary_map()
```

output:

```
$ python test_threadpool.py
pool_map
cost: 0.562669038773
ordinary_map
cost: 0.38525390625
```

## 8.7 Mutex lock

Simplest synchronization primitive lock

```
>>> from threading import Thread
>>> from threading import Lock
>>> lock = Lock()
>>> def getlock(id):
```

(continues on next page)

(continued from previous page)

```
... lock.acquire()
... print("task{0} get".format(id))
... lock.release()
...
>>> t1=Thread(target=getlock,args=(1,))
>>> t2=Thread(target=getlock,args=(2,))
>>> t1.start();t2.start()
task1 get
task2 get

# using lock manager
>>> def getlock(id):
...     with lock:
...         print("task%d get" % id)
...
>>> t1=Thread(target=getlock,args=(1,))
>>> t2=Thread(target=getlock,args=(2,))
>>> t1.start();t2.start()
task1 get
task2 get
```

## 8.8 Deadlock

Happen when more than one mutex lock.

```
>>> import threading
>>> import time
>>> lock1 = threading.Lock()
>>> lock2 = threading.Lock()
>>> def task1():
...     with lock1:
...         print("get lock1")
...         time.sleep(3)
...         with lock2:
...             print("No deadlock")
...
>>> def task2():
...     with lock2:
...         print("get lock2")
...         with lock1:
...             print("No deadlock")
...
>>> t1=threading.Thread(target=task1)
>>> t2=threading.Thread(target=task2)
>>> t1.start();t2.start()
get lock1
get lock2

>>> t1.isAlive()
True
>>> t2.isAlive()
True
```

## 8.9 Implement “Monitor”

Using RLock

```
# ref: An introduction to Python Concurrency - David Beazley
from threading import Thread
from threading import RLock
import time

class monitor(object):
    lock = RLock()
    def foo(self,tid):
        with monitor.lock:
            print("%d in foo" % tid)
            time.sleep(5)
            self.ker(tid)

    def ker(self,tid):
        with monitor.lock:
            print("%d in ker" % tid)

m = monitor()
def task1(id):
    m.foo(id)

def task2(id):
    m.ker(id)

t1 = Thread(target=task1,args=(1,))
t2 = Thread(target=task2,args=(2,))
t1.start()
t2.start()
t1.join()
t2.join()
```

output:

```
$ python monitor.py
1 in foo
1 in ker
2 in ker
```

## 8.10 Control primitive resources

Using Semaphore

```
from threading import Thread
from threading import Semaphore
from random import random
import time

# limit resource to 3
sema = Semaphore(3)
def foo(tid):
    with sema:
        print("%d acquire sema" % tid)
```

(continues on next page)

(continued from previous page)

```
        wt = random()*5
        time.sleep(wt)
        print("%d release sema" % tid)

threads = []
for _t in range(5):
    t = Thread(target=foo, args=(_t,))
    threads.append(t)
    t.start()
for _t in threads:
    _t.join()
```

output:

```
python semaphore.py
0 acquire sema
1 acquire sema
2 acquire sema
0 release sema
3 acquire sema
2 release sema
4 acquire sema
1 release sema
4 release sema
3 release sema
```

## 8.11 Ensure tasks has done

Using 'event'

```
from threading import Thread
from threading import Event
import time

e = Event()

def worker(id):
    print("%d wait event" % id)
    e.wait()
    print("%d get event set" % id)

t1=Thread(target=worker, args=(1,))
t2=Thread(target=worker, args=(2,))
t3=Thread(target=worker, args=(3,))
t1.start()
t2.start()
t3.start()

# wait sleep task(event) happen
time.sleep(3)
e.set()
```

output:

```
python event.py
1 wait event
2 wait event
3 wait event
2 get event set
 3 get event set
1 get event set
```

## 8.12 Thread-safe priority queue

Using ‘condition’

```
import threading
import heapq
import time
import random

class PriorityQueue(object):
    def __init__(self):
        self._q = []
        self._count = 0
        self._cv = threading.Condition()

    def __str__(self):
        return str(self._q)

    def __repr__(self):
        return self._q

    def put(self, item, priority):
        with self._cv:
            heapq.heappush(self._q, (-priority, self._count, item))
            self._count += 1
            self._cv.notify()

    def pop(self):
        with self._cv:
            while len(self._q) == 0:
                print("wait...")
                self._cv.wait()
            ret = heapq.heappop(self._q)[-1]
            return ret

priq = PriorityQueue()
def producer():
    while True:
        print(priq.pop())

def consumer():
    while True:
        time.sleep(3)
        print("consumer put value")
        priority = random.random()
        priq.put(priority, priority*10)
```

(continues on next page)

(continued from previous page)

```
for _ in range(3):
    priority = random.random()
    priq.put(priority,priority*10)

t1=threading.Thread(target=producer)
t2=threading.Thread(target=consumer)
t1.start();t2.start()
t1.join();t2.join()
```

output:

```
python3 thread_safe.py
0.6657491871045683
0.52787974399991247
0.20990624606296315
wait...
consumer put value
0.09123101305407577
wait...
```

## 8.13 Multiprocessing

Solving GIL problem via processes

```
>>> from multiprocessing import Pool
>>> def fib(n):
...     if n <= 2:
...         return 1
...     return fib(n-1) + fib(n-2)
...
>>> def profile(func):
...     def wrapper(*args, **kwargs):
...         import time
...         start = time.time()
...         func(*args, **kwargs)
...         end = time.time()
...         print(end - start)
...     return wrapper
...
>>> @profile
... def nomultiprocess():
...     map(fib, [35]*5)
...
>>> @profile
... def hasmultiprocess():
...     pool = Pool(5)
...     pool.map(fib, [35]*5)
...
>>> nomultiprocess()
23.8454811573
>>> hasmultiprocess()
13.2433719635
```

## 8.14 Custom multiprocessing map

```

from multiprocessing import Process, Pipe
from itertools import izip

def spawn(f):
    def fun(pipe,x):
        pipe.send(f(x))
        pipe.close()
    return fun

def parmap(f,X):
    pipe=[Pipe() for x in X]
    proc=[Process(target=spawn(f),
        args=(c,x)
        for x,(p,c) in izip(X,pipe)]
    [p.start() for p in proc]
    [p.join() for p in proc]
    return [p.recv() for (p,c) in pipe]

print (parmap(lambda x:x**x,range(1,5)))

```

## 8.15 Graceful way to kill all child processes

```

from __future__ import print_function

import signal
import os
import time

from multiprocessing import Process, Pipe

NUM_PROCESS = 10

def aurora(n):
    while True:
        time.sleep(n)

if __name__ == "__main__":
    procs = [Process(target=aurora, args=(x,))
        for x in range(NUM_PROCESS)]
    try:
        for p in procs:
            p.daemon = True
            p.start()
        [p.join() for p in procs]
    finally:
        for p in procs:
            if not p.is_alive(): continue
            os.kill(p.pid, signal.SIGKILL)

```

## 8.16 Simple round-robin scheduler

```

>>> def fib(n):
...     if n <= 2:
...         return 1
...     return fib(n-1)+fib(n-2)
...
>>> def gen_fib(n):
...     for _ in range(1,n+1):
...         yield fib(_)
...
>>> t=[gen_fib(5),gen_fib(3)]
>>> from collections import deque
>>> tasks = deque()
>>> tasks.extend(t)
>>> def run(tasks):
...     while tasks:
...         try:
...             task = tasks.popleft()
...             print(task.next())
...             tasks.append(task)
...         except StopIteration:
...             print("done")
...
>>> run(tasks)
1
1
1
1
2
2
3
done
5
done

```

## 8.17 Scheduler with blocking function

```

# ref: PyCon 2015 - David Beazley
import socket
from select import select
from collections import deque

tasks = deque()
r_wait = {}
s_wait = {}

def fib(n):
    if n <= 2:
        return 1
    return fib(n-1)+fib(n-2)

process cost: 5.538189888000488
```

## 8.19 How to use ThreadPoolExecutor?

```
from concurrent.futures import ThreadPoolExecutor

def fib(n):
    if n <= 2:
        return 1
    return fib(n - 1) + fib(n - 2)

with ThreadPoolExecutor(max_workers=3) as ex:
    futs = []
    for x in range(3):
        futs.append(ex.submit(fib, 30+x))

    res = [fut.result() for fut in futs]

print(res)
```

output:

```
$ python3 thread_pool_ex.py
[832040, 1346269, 2178309]
```

## 8.20 What “with ThreadPoolExecutor” doing?

```
from concurrent import futures

def fib(n):
    if n <= 2:
        return 1
    return fib(n-1) + fib(n-2)

with futures.ThreadPoolExecutor(3) as e:
    fut = e.submit(fib, 30)
    res = fut.result()
    print(res)

# equal to
e = futures.ThreadPoolExecutor(3)
fut = e.submit(fib, 30)
fut.result()
e.shutdown(wait=True)
print(res)
```

output:

```
$ python3 thread_pool_exec.py
832040
832040
```

## 8.21 Future Object

```
# future: deferred computation
# add_done_callback
from concurrent import futures

def fib(n):
    if n <= 2:
        return 1
    return fib(n-1) + fib(n-2)

def handler(future):
    res = future.result()
    print("res: {}".format(res))

def thread_v1():
    with futures.ThreadPoolExecutor(3) as e:
        for _ in range(3):
            f = e.submit(fib, 30+_ )
            f.add_done_callback(handler)
        print("end")

def thread_v2():
    to_do = []
    with futures.ThreadPoolExecutor(3) as e:
        for _ in range(3):
            fut = e.submit(fib, 30+_ )
            to_do.append(fut)
        for _f in futures.as_completed(to_do):
            res = _f.result()
            print("res: {}".format(res))
    print("end")
```

output:

```
$ python3 -i fut.py
>>> thread_v1()
res: 832040
res: 1346269
res: 2178309
end
>>> thread_v2()
res: 832040
res: 1346269
res: 2178309
end
```

## 8.22 Future error handling

```
from concurrent import futures

def spam():
    raise RuntimeError

def handler(future):
    print("callback handler")
    try:
        res = future.result()
    except RuntimeError:
        print("get RuntimeError")

def thread_spam():
    with futures.ThreadPoolExecutor(2) as e:
        f = e.submit(spam)
        f.add_done_callback(handler)
```

output:

```
$ python -i fut_err.py
>>> thread_spam()
callback handler
get RuntimeError
```

## 9.1 Set a database URL

```
from sqlalchemy.engine.url import URL

postgres_db = {'drivername': 'postgres',
               'username': 'postgres',
               'password': 'postgres',
               'host': '192.168.99.100',
               'port': 5432}
print(URL(**postgres_db))

sqlite_db = {'drivername': 'sqlite', 'database': 'db.sqlite'}
print(URL(**sqlite_db))
```

output:

```
$ python sqlalchemy_url.py
postgres://postgres:postgres@192.168.99.100:5432
sqlite:///db.sqlite
```

## 9.2 Sqlalchemy Support DBAPI - PEP249

```
from sqlalchemy import create_engine

db_uri = "sqlite:///db.sqlite"
engine = create_engine(db_uri)
```

(continues on next page)

(continued from previous page)

```

# DBAPI - PEP249
# create table
engine.execute('CREATE TABLE "EX1" ('
                'id INTEGER NOT NULL,'
                'name VARCHAR, '
                'PRIMARY KEY (id));')

# insert a row
engine.execute('INSERT INTO "EX1" '
                '(id, name) '
                'VALUES (1,"raw1")')

# select *
result = engine.execute('SELECT * FROM '
                        '"EX1"')

for _r in result:
    print(_r)

# delete *
engine.execute('DELETE from "EX1" where id=1;')
result = engine.execute('SELECT * FROM "EX1"')
print(result.fetchall())

```

### 9.3 Transaction and Connect Object

```

from sqlalchemy import create_engine

db_uri = 'sqlite:///db.sqlite'
engine = create_engine(db_uri)

# Create connection
conn = engine.connect()
# Begin transaction
trans = conn.begin()
conn.execute('INSERT INTO "EX1" (name) '
             'VALUES ("Hello")')
trans.commit()
# Close connection
conn.close()

```

### 9.4 Metadata - Generating Database Schema

```

from sqlalchemy import create_engine
from sqlalchemy import MetaData
from sqlalchemy import Table
from sqlalchemy import Column
from sqlalchemy import Integer, String

db_uri = 'sqlite:///db.sqlite'
engine = create_engine(db_uri)

# Create a metadata instance

```

(continues on next page)

(continued from previous page)

```
metadata = MetaData(engine)
# Declare a table
table = Table('Example', metadata,
              Column('id', Integer, primary_key=True),
              Column('name', String))
# Create all tables
metadata.create_all()
for _t in metadata.tables:
    print("Table: ", _t)
```

## 9.5 Inspect - Get Database Information

```
from sqlalchemy import create_engine
from sqlalchemy import inspect

db_uri = 'sqlite:///db.sqlite'
engine = create_engine(db_uri)

inspector = inspect(engine)

# Get table information
print(inspector.get_table_names())

# Get column information
print(inspector.get_columns('EX1'))
```

## 9.6 Reflection - Loading Table from Existing Database

```
from sqlalchemy import create_engine
from sqlalchemy import MetaData
from sqlalchemy import Table

db_uri = 'sqlite:///db.sqlite'
engine = create_engine(db_uri)

# Create a MetaData instance
metadata = MetaData()
print(metadata.tables)

# reflect db schema to MetaData
metadata.reflect(bind=engine)
print(metadata.tables)
```

## 9.7 Get Table from MetaData

```
from sqlalchemy import create_engine
from sqlalchemy import MetaData
from sqlalchemy import Table
```

(continues on next page)

(continued from previous page)

```

db_uri = 'sqlite:///db.sqlite'
engine = create_engine(db_uri)

# Create MetaData instance
metadata = MetaData(engine, reflect=True)
print(metadata.tables)

# Get Table
ex_table = metadata.tables['Example']
print(ex_table)

```

## 9.8 Create all Tables Store in “MetaData”

```

from sqlalchemy import create_engine
from sqlalchemy import MetaData
from sqlalchemy import Table
from sqlalchemy import Column
from sqlalchemy import Integer, String

db_uri = 'sqlite:///db.sqlite'
engine = create_engine(db_uri)
meta = MetaData(engine)

# Register t1, t2 to metadata
t1 = Table('EX1', meta,
           Column('id', Integer, primary_key=True),
           Column('name', String))

t2 = Table('EX2', meta,
           Column('id', Integer, primary_key=True),
           Column('val', Integer))

# Create all tables in meta
meta.create_all()

```

## 9.9 Create Specific Table

```

from sqlalchemy import create_engine
from sqlalchemy import MetaData
from sqlalchemy import Table
from sqlalchemy import Column
from sqlalchemy import Integer, String

db_uri = 'sqlite:///db.sqlite'
engine = create_engine(db_uri)

meta = MetaData(engine)
t1 = Table('Table_1', meta,
           Column('id', Integer, primary_key=True),
           Column('name', String))
t2 = Table('Table_2', meta,

```

(continues on next page)

(continued from previous page)

```
        Column('id', Integer, primary_key=True),
        Column('val', Integer))
t1.create()
```

## 9.10 Create table with same columns

```
from sqlalchemy import (
    create_engine,
    inspect,
    Column,
    String,
    Integer)

from sqlalchemy.ext.declarative import declarative_base

db_url = "sqlite://"
engine = create_engine(db_url)

Base = declarative_base()

class TemplateTable(object):
    id = Column(Integer, primary_key=True)
    name = Column(String)
    age = Column(Integer)

class DowntownAPeople(TemplateTable, Base):
    __tablename__ = "downtown_a_people"

class DowntownBPeople(TemplateTable, Base):
    __tablename__ = "downtown_b_people"

Base.metadata.create_all(bind=engine)

# check table exists
ins = inspect(engine)
for _t in ins.get_table_names():
    print(_t)
```

## 9.11 Drop a Table

```
from sqlalchemy import create_engine
from sqlalchemy import MetaData
from sqlalchemy import inspect
from sqlalchemy import Table
from sqlalchemy import Column, Integer, String
from sqlalchemy.engine.url import URL

db_url = {'drivername': 'postgres',
         'username': 'postgres',
         'password': 'postgres',
         'host': '192.168.99.100',
```

(continues on next page)

(continued from previous page)

```

        'port': 5432}
engine = create_engine(URL(**db_url))
m = MetaData()
table = Table('Test', m,
              Column('id', Integer, primary_key=True),
              Column('key', String, nullable=True),
              Column('val', String))

table.create(engine)
inspector = inspect(engine)
print('Test' in inspector.get_table_names())

table.drop(engine)
inspector = inspect(engine)
print('Test' in inspector.get_table_names())

```

output:

```

$ python sqlalchemy_drop.py
$ True
$ False

```

## 9.12 Some Table Object Operation

```

from sqlalchemy import MetaData
from sqlalchemy import Table
from sqlalchemy import Column
from sqlalchemy import Integer, String

meta = MetaData()
t = Table('ex_table', meta,
          Column('id', Integer, primary_key=True),
          Column('key', String),
          Column('val', Integer))

# Get Table Name
print(t.name)

# Get Columns
print(t.columns.keys())

# Get Column
c = t.c.key
print(c.name)
# Or
c = t.columns.key
print(c.name)

# Get Table from Column
print(c.table)

```

## 9.13 SQL Expression Language

```

# Think Column as "ColumnElement"
# Implement via overwrite special function
from sqlalchemy import MetaData
from sqlalchemy import Table
from sqlalchemy import Column
from sqlalchemy import Integer, String
from sqlalchemy import or_

meta = MetaData()
table = Table('example', meta,
              Column('id', Integer, primary_key=True),
              Column('l_name', String),
              Column('f_name', String))

# sql expression binary object
print(repr(table.c.l_name == 'ed'))
# exhibit sql expression
print(str(table.c.l_name == 'ed'))

print(repr(table.c.f_name != 'ed'))

# comparison operator
print(repr(table.c.id > 3))

# or expression
print((table.c.id > 5) | (table.c.id < 2))
# Equal to
print(or_(table.c.id > 5, table.c.id < 2))

# compare to None produce IS NULL
print(table.c.l_name == None)
# Equal to
print(table.c.l_name.is_(None))

# + means "addition"
print(table.c.id + 5)
# or means "string concatenation"
print(table.c.l_name + "some name")

# in expression
print(table.c.l_name.in_(['a', 'b']))

```

## 9.14 insert() - Create an “INSERT” Statement

```

from sqlalchemy import create_engine
from sqlalchemy import MetaData
from sqlalchemy import Table
from sqlalchemy import Column
from sqlalchemy import Integer
from sqlalchemy import String

db_uri = 'sqlite:///db.sqlite'
engine = create_engine(db_uri)

```

(continues on next page)

(continued from previous page)

```
# create table
meta = MetaData(engine)
table = Table('user', meta,
              Column('id', Integer, primary_key=True),
              Column('l_name', String),
              Column('f_name', String))
meta.create_all()

# insert data via insert() construct
ins = table.insert().values(
    l_name='Hello',
    f_name='World')
conn = engine.connect()
conn.execute(ins)

# insert multiple data
conn.execute(table.insert(), [
    {'l_name': 'Hi', 'f_name': 'bob'},
    {'l_name': 'yo', 'f_name': 'alice'}])
```

## 9.15 select() - Create a “SELECT” Statement

```
from sqlalchemy import create_engine
from sqlalchemy import MetaData
from sqlalchemy import Table
from sqlalchemy import select
from sqlalchemy import or_

db_uri = 'sqlite:///db.sqlite'
engine = create_engine(db_uri)
conn = engine.connect()

meta = MetaData(engine, reflect=True)
table = meta.tables['user']

# select * from 'user'
select_st = select([table]).where(
    table.c.l_name == 'Hello')
res = conn.execute(select_st)
for _row in res:
    print(_row)

# or equal to
select_st = table.select().where(
    table.c.l_name == 'Hello')
res = conn.execute(select_st)
for _row in res:
    print(_row)

# combine with "OR"
select_st = select([
    table.c.l_name,
    table.c.f_name]).where(or_(
```

(continues on next page)

(continued from previous page)

```
        table.c.l_name == 'Hello',
        table.c.l_name == 'Hi'))
res = conn.execute(select_st)
for _row in res:
    print(_row)

# combine with "ORDER_BY"
select_st = select([table]).where(or_(
    table.c.l_name == 'Hello',
    table.c.l_name == 'Hi')).order_by(table.c.f_name)
res = conn.execute(select_st)
for _row in res:
    print(_row)
```

## 9.16 join() - Joined Two Tables via “JOIN” Statement

```
from sqlalchemy import create_engine
from sqlalchemy import MetaData
from sqlalchemy import Table
from sqlalchemy import Column
from sqlalchemy import Integer
from sqlalchemy import String
from sqlalchemy import select

db_uri = 'sqlite:///db.sqlite'
engine = create_engine(db_uri)

meta = MetaData(engine, reflect=True)
email_t = Table('email_addr', meta,
    Column('id', Integer, primary_key=True),
    Column('email', String),
    Column('name', String))
meta.create_all()

# get user table
user_t = meta.tables['user']

# insert
conn = engine.connect()
conn.execute(email_t.insert(), [
    {'email': 'ker@test', 'name': 'Hi'},
    {'email': 'yo@test', 'name': 'Hello'}])
# join statement
join_obj = user_t.join(email_t,
    email_t.c.name == user_t.c.l_name)
# using select_from
sel_st = select(
    [user_t.c.l_name, email_t.c.email]).select_from(join_obj)
res = conn.execute(sel_st)
for _row in res:
    print(_row)
```

## 9.17 Delete Rows from Table

```

from sqlalchemy import create_engine
from sqlalchemy import MetaData

db_uri = 'sqlite:///db.sqlite'
engine = create_engine(db_uri)
conn = engine.connect()

meta = MetaData(engine, reflect=True)
user_t = meta.tables['user']

# select * from user_t
sel_st = user_t.select()
res = conn.execute(sel_st)
for _row in res:
    print(_row)

# delete l_name == 'Hello'
del_st = user_t.delete().where(
    user_t.c.l_name == 'Hello')
print('----- delete -----')
res = conn.execute(del_st)

# check rows has been delete
sel_st = user_t.select()
res = conn.execute(sel_st)
for _row in res:
    print(_row)

```

## 9.18 Check Table Existing

```

from sqlalchemy import create_engine
from sqlalchemy import MetaData
from sqlalchemy import Column
from sqlalchemy import Integer, String
from sqlalchemy import inspect
from sqlalchemy.ext.declarative import declarative_base

Modal = declarative_base()
class Example(Modal):
    __tablename__ = "ex_t"
    id = Column(Integer, primary_key=True)
    name = Column(String(20))

db_uri = 'sqlite:///db.sqlite'
engine = create_engine(db_uri)
Modal.metadata.create_all(engine)

# check register table exist to Modal
for _t in Modal.metadata.tables:
    print(_t)

# check all table in database

```

(continues on next page)

(continued from previous page)

```
meta = MetaData(engine, reflect=True)
for _t in meta.tables:
    print(_t)

# check table names exists via inspect
ins = inspect(engine)
for _t in ins.get_table_names():
    print(_t)
```

## 9.19 Create multiple tables at once

```
from sqlalchemy import create_engine
from sqlalchemy import MetaData
from sqlalchemy import Table
from sqlalchemy import inspect
from sqlalchemy import Column, String, Integer
from sqlalchemy.engine.url import URL

db = {'drivername': 'postgres',
      'username': 'postgres',
      'password': 'postgres',
      'host': '192.168.99.100',
      'port': 5432}

url = URL(**db)
engine = create_engine(url)

metadata = MetaData()
metadata.reflect(bind=engine)

def create_table(name, metadata):
    tables = metadata.tables.keys()
    if name not in tables:
        table = Table(name, metadata,
                      Column('id', Integer, primary_key=True),
                      Column('key', String),
                      Column('val', Integer))
        table.create(engine)

tables = ['table1', 'table2', 'table3']
for _t in tables: create_table(_t, metadata)

inspector = inspect(engine)
print(inspector.get_table_names())
```

output:

```
$ python sqlalchemy_create.py
[u'table1', u'table2', u'table3']
```

## 9.20 Create tables with dynamic columns (Table)

```

from sqlalchemy import create_engine
from sqlalchemy import Column, Integer, String
from sqlalchemy import Table
from sqlalchemy import MetaData
from sqlalchemy import inspect
from sqlalchemy.engine.url import URL

db_url = {'drivername': 'postgres',
          'username': 'postgres',
          'password': 'postgres',
          'host': '192.168.99.100',
          'port': 5432}

engine = create_engine(URL(**db_url))

## 10.17 Asynchronous context manager

```
# ref: PEP-0492
# need Python >= 3.5

>>> class AsyncCtxMgr:
...     async def __aenter__(self):
...         await asyncio.sleep(3)
...         print("__aenter__")
...         return self
...     async def __aexit__(self, *exc):
...         await asyncio.sleep(1)
...         print("__aexit__")
...

```

(continues on next page)

(continued from previous page)

```

>>> async def hello():
...     async with AsyncCtxMgr() as m:
...         print("hello block")
...
>>> async def world():
...     print("world block")
...
>>> t = loop.create_task(world())
>>> loop.run_until_complete(hello())
world block
__anenter__
hello block
__aexit__

```

## 10.18 What is asynchronous context manager

```

>>> import asyncio
>>> class AsyncManager:
...     async def __anenter__(self):
...         await asyncio.sleep(5)
...         print("__anenter__")
...     async def __aexit__(self, *exc_info):
...         await asyncio.sleep(3)
...         print("__aexit__")
...
>>> async def foo():
...     import sys
...     mgr = AsyncManager()
...     await mgr.__anenter__()
...     print("body")
...     await mgr.__aexit__(*sys.exc_info())
...
>>> loop = asyncio.get_event_loop()
>>> loop.run_until_complete(loop.create_task(foo()))
__anenter__
body
__aexit__

```

## 10.19 decorator @asynccontextmanager

### New in Python 3.7

- Issue 29679 - Add @contextlib.asynccontextmanager

```

>>> import asyncio
>>> from contextlib import asynccontextmanager
>>> @asynccontextmanager
... async def coro(msg):
...     await asyncio.sleep(1)
...     yield msg
...     await asyncio.sleep(0.5)
...     print('done')

```

(continues on next page)

(continued from previous page)

```

...
>>> async def main():
...     async with coro("Hello") as m:
...         await asyncio.sleep(1)
...         print(m)
...
>>> loop = asyncio.get_event_loop()
>>> loop.run_until_complete(main())
Hello
done

```

## 11.17 Mock - using @patch substitute original method

```
# python-3.3 or above

>>> from unittest.mock import patch
>>> import os
>>> def fake_remove(path, *a, **k):
...     print("remove done")
...
>>> @patch('os.remove', fake_remove)
... def test():
...     try:
...         os.remove('%$!?!&*') # fake os.remove
...     except OSError as e:
...         print(e)
...     else:
...         print('test success')
...
>>> test()
remove done
test success
```

---

**Note:** Without mock, above test will always fail.

---

```

>>> import os
>>> def test():
...     try:
...         os.remove('%$!?!?&*')
...     except OSError as e:
...         print(e)
...     else:
...         print('test success')
...
>>> test()
[Errno 2] No such file or directory: '%$!?!?&*'

```

## 11.18 What with unittest.mock.patch do?

```

from unittest.mock import patch
import os

PATH = '$@!%?&'

def fake_remove(path):
    print("Fake remove")

class SimplePatch:

    def __init__(self, target, new):
        self._target = target
        self._new = new

    def get_target(self, target):
        target, attr = target.rsplit('.', 1)
        getter = __import__(target)
        return getter, attr

    def __enter__(self):
        orig, attr = self.get_target(self._target)
        self.orig, self.attr = orig, attr
        self.orig_attr = getattr(orig, attr)
        setattr(orig, attr, self._new)
        return self._new

    def __exit__(self, *exc_info):
        setattr(self.orig, self.attr, self.orig_attr)
        del self.orig_attr

print('---> inside unittest.mock.patch scope')
with patch('os.remove', fake_remove):
    os.remove(PATH)

print('---> inside simple patch scope')
with SimplePatch('os.remove', fake_remove):
    os.remove(PATH)

print('---> outside patch scope')

```

(continues on next page)

(continued from previous page)

```
try:
    os.remove(PATH)
except OSError as e:
    print(e)
```

output:

```
$ python3 simple_patch.py
--> inside unittest.mock.patch scope
Fake remove
--> inside simple patch scope
Fake remove
--> outside patch scope
[Errno 2] No such file or directory: '$@!%?&'
```

## 11.19 Mock - substitute open

```
>>> import urllib
>>> from unittest.mock import patch, mock_open
>>> def send_req(url):
...     with urllib.request.urlopen(url) as f:
...         if f.status == 200:
...             return f.read()
...         raise urllib.error.URLError
...
>>> fake_html = b'<html><h1>Mock Content</h1></html>'
>>> mock_urlopen = mock_open(read_data=fake_html)
>>> ret = mock_urlopen.return_value
>>> ret.status = 200

...         print("I am decorator")
...         ret = func(*args, **kwargs)
...         return ret
...     return wrapper
...
>>> @decorator
... def hello(str):
...     print("Hello {}".format(str))
...
>>> @decorator
... def add(a,b):
...     print("add %d+%d=%d" % (a,b,a+b))
...     return a+b
...
>>> hello("KerKer")
I am decorator
Hello KerKer
>>> add(1,2)
I am decorator
add 1+2=3
3

```

## C

```

#include <stdio.h>

#define DECORATOR(t, f, declar, input) \
    t decor_##f(declar) { \
        printf("I am decorator\n"); \
        return f(input);\
    }

#define FUNC_DEC(func, ...) \
    decor_##func(__VA_ARGS__)

// Original function
void hello(char *str) {
    printf("Hello %s\n", str);
}

int add(int a, int b) {
    printf("add %d + %d = %d\n", a,b,a+b);
    return a+b;
}

// Patch function
#define DECLAR    char *str
#define INPUT    str
DECORATOR(void, hello, DECLAR, INPUT)
#undef DECLAR
#undef INPUT

#define DECLAR    int a, int b
#define INPUT    a,b
DECORATOR(int, add, DECLAR, INPUT)
#undef DECLAR
#undef INPUT

```

(continues on next page)

(continued from previous page)

```
int main(int argc, char *argv[]) {
    FUNC_DEC(hello, "KerKer");
    FUNC_DEC(add,1,2);

    return 0;
}
```

output:

```
$ gcc example.c
$ ./a.out
I am decorator
Hello KerKer
I am decorator
add 1 + 2 = 3
```

## 13.2 A Set of Functions

Python

```
>>> def func_1():
...     print("Hello")
...
>>> def func_2():
...     print("World")
...
>>> def func_3():
...     print("!!!")
...
>>> s = [func_1,func_2,func_3]
>>> for _ in s: _()
...
Hello
World
!!!
```

C

```
#include <stdio.h>

typedef void (*func)(void);

enum func_id{
    FUNC_1,FUNC_2,FUNC_3
};

void func_1() {
    printf("Hello ");
}
void func_2() {
    printf("World ");
}
void func_3() {
```

(continues on next page)

(continued from previous page)

```
    printf("!!!\n");
}

func gFuncTable[] = {
    func_1, func_2, func_3
};

int main(int argc, char *argv[]) {
    gFuncTable[FUNC_1] ();
    gFuncTable[FUNC_2] ();
    gFuncTable[FUNC_3] ();

    return 0;
}
```

## 13.3 Closure in C

Python

```
# implement via __call__
>>> class closure(object):
...     def __init__(self):
...         self.val = 5566
...     def __call__(self, var):
...         self.val += var
...
>>> c = closure()
>>> c(9527)
>>> print(c.val)
15093
# using "global" keyword
>>> x = 0
>>> def closure(val):
...     def wrapper():
...         global x
...         x += val
...         print(x)
...     wrapper()
...
>>> closure(5566)
5566
>>> closure(9527)
15093
# using "nonlocal" (only in python3)
>>> def closure(val):
...     x = 0
...     def wrapper():
...         nonlocal x
...         x += val
...         print(x)
...     wrapper()
...
>>> closure(5566)
5566
```

(continues on next page)

(continued from previous page)

```
>>> closure(9527)
9527
```

## C

```
#include <stdio.h>
#include <stdlib.h>

typedef struct Closure {
    int val;
    void (*add) (struct Closure **, int);
}closure;

void add_func(closure **c, int var) {
    (*c)->val += var;
}

int main(int argc, char *argv[]) {
    closure *c = NULL;
    c = malloc(sizeof(closure));
    c->val = 5566;
    c->add = add_func;
    c->add(&c, 9527);
    printf("result: %d\n", c->val);

    return 0;
}
```

## 13.4 Generator

## Python

```
>>> def gen():
...     var = 0
...     while True:
...         var += 1
...         yield var
...
>>> g = gen()
>>> for _ in range(3):
...     print(next(g), end=' ')
...
1 2 3 >>>
```

## C

```
#include <stdio.h>
#include <stdlib.h>

struct gen {
    int (*next) (struct gen *);
    int var;
};
```

(continues on next page)

(continued from previous page)

```

int next_func(struct gen *g) {
    printf("var = %d\n",g->var);
    g->var +=1;
    return g->var;
}

struct gen * new_gen() {
    struct gen *g = NULL;
    g = (struct gen*)
        malloc(sizeof(struct gen));
    g->var = 0;
    g->next = next_func;
    return g;
}

int main(int argc, char *argv[]) {
    struct gen *g = new_gen();
    int i = 0;
    for (i=0;i<3;i++) {
        printf("gen var = %d\n",g->next(g));
    }
    return 0;
}

```

## 13.5 Context Manager in C

Python

```

>>> class CtxManager(object):
...     def __enter__(self):
...         self._attr = "KerKer"
...         return self._attr
...     def __exit__(self,*e_info):
...         del self._attr
...
>>> with CtxManager() as c:
...     print(c)
...
KerKer

```

C

```

#include <stdio.h>
#include <stdlib.h>

#define ENTER(type,ptr,len) \
    printf("enter context manager\n");\
    ptr = malloc(sizeof(type)*len);\
    if (NULL == ptr) { \
        printf("malloc get error\n");\
        goto exit;\
    }\

#define EXIT(ptr) \

```

(continues on next page)

(continued from previous page)

```

exit:\
    printf("exit context manager\n");\
    if (NULL != ptr) {\
        free(ptr);\
        ptr = NULL; \
    }\

#define CONTEXT_MANAGER(t, p, l,...){\
    ENTER(t,p,l)\
    __VA_ARGS__ \
    EXIT(p)\
}

int main(int argc, char *argv[]) {
    char *ptr;
    CONTEXT_MANAGER(char, ptr, 128,
        sprintf(ptr, "Hello World");
        printf("%s\n",ptr);
    );
    printf("ptr = %s\n",ptr);
    return 0;
}

```

## 13.6 Tuple in C

Python

```

>>> a = ("Hello", "World", 123)
>>> for x in a:
...     print(x, end=' ')
...
Hello World 123 >>>

```

C

```

#include <stdio.h>

int main(int argc, char *argv[]) {
    int a = 123;
    void * const x[4] = {"Hello",
                        "World",&a};
    printf("%s %s, %d\n",x[0],x[1],*(int *)x[2]);
    return 0;
}

```

## 13.7 Error Handling

Python

```

>>> import os
>>> def spam(a,b):

```

(continues on next page)

(continued from previous page)

```

...     try:
...         os.listdir('.')
...     except OSError:
...         print("listdir get error")
...         return
...     try:
...         a/b
...     except ZeroDivisionError:
...         print("zero division")
...         return
...
>>> spam(1,0)
zero division
# single exit -> using decorator
>>> import time
>>> def profile(func):
...     def wrapper(*args, **kwargs):
...         s = time.time()
...         ret = func(*args, **kwargs)
...         e = time.time()
...         print(e - s)
...         return ret
...     return wrapper
...
>>> @profile
... def spam(a,b):
...     try:
...         os.listdir('.')
...     except OSError:
...         return
...     try:
...         a/b
...     except ZeroDivisionError:
...         return
...
>>> spam(1,0)
0.000284910202026

```

C

```

#include <stdio.h>
#include <stdlib.h>
#include <string.h>

int main(int argc, char *argv[]) {
    int ret = -1;
    char *ptr;
    ptr = malloc(sizeof(char)*128);
    if (NULL == ptr) {
        perror("malloc get error");
        goto exit;
    }
    strcpy(ptr, "KerKer");
    printf("%s\n", ptr);
    ret = 0;
exit:
    if (ptr) {

```

(continues on next page)

(continued from previous page)

```

    free(ptr);
    ptr = NULL;
}
return ret;
}

```

## 13.8 Simple try: exp except: exp finally: in C

Python

```

>>> try:
...     # do something...
...     raise OSError
... except OSError as e:
...     print('get error OSError')
... finally:
...     print('finally block')
...
get error OSError
finally block

```

C

```

#include <stdio.h>
#include <string.h>
#include <setjmp.h>

enum {
    ERR_EPERM = 1,
    ERR_ENOENT,
    ERR_ESRCH,
    ERR_EINTR,
    ERR_EIO
};

#define try    do { jmp_buf jmp_env__;          \
                  switch ( setjmp(jmp_env__) ) { \
                      case 0: while(1) {
#define except(exc)    break;                  \
                      case exc:
#define finally        break; }               \
                      default:
#define end    } } while(0)

#define raise(exc) longjmp(jmp_env__, exc)

int main(int argc, char *argv[])
{
    int ret = 0;

    try {
        raise(ERR_ENOENT);
    } except (ERR_EPERM) {
        printf("get exception: %s\n", strerror(ERR_EPERM));

```

(continues on next page)

(continued from previous page)

```

    ret = -1;
} except (ERR_ENOENT) {
    printf("get exception: %s\n", strerror(ERR_ENOENT));
    ret = -1;
} except (ERR_ESRCH) {
    printf("get exception: %s\n", strerror(ERR_ENOENT));
    ret = -1;
} finally {
    printf("finally block\n");
} end;
return ret;
}

```

## 13.9 Simple coroutine in C

Python

```

from collections import deque

_registry = { }
_msg_queue = deque()

def send(name, msg):
    _msg_queue.append((name, msg))

def actor(func):
    def wrapper(*args, **kwargs):
        gen = func(*args, **kwargs)
        next(gen)
        _registry[func.__name__] = gen
    return wrapper

@actor
def ping():
    """ coroutine ping """
    n = yield
    print('ping %d' % n)
    send('pong', 20001)

    n = yield
    print('ping %d' % n)
    send('pong', 20002)

@actor
def pong():
    """ coroutine pong """
    n = yield
    print('pong %d' % n)
    send('ping', 10001)

    n = yield
    print('pong %d' % n)
    send('ping', 10002)

```

(continues on next page)

(continued from previous page)

```

def run():
    while _msg_queue:
        try:
            name, msg = _msg_queue.popleft()
            _registry[name].send(msg)
        except StopIteration:
            pass

ping()
pong()
send('ping', 10001)
run()

```

output:

```

$ python coro.py
ping 10001
pong 20001
ping 10001
pong 20002

```

## C

```

#include <stdio.h>
#include <string.h>
#include <setjmp.h>

static jmp_buf jmp_ping, jmp_pong;

#define send(buf_a, buf_b, val) \
    do { \
        r = setjmp(buf_a); \
        if (r == 0) { \
            longjmp(buf_b, val); \
        } \
    } while(0)

#define GEN_FUNC(func) void func

GEN_FUNC(ping) ();
GEN_FUNC(pong) ();

GEN_FUNC(ping) ()
{
    int r = 0;

    r = setjmp(jmp_ping);
    if (r == 0) pong();

    /* ping -- 20001 -> pong */
    send(jmp_ping, jmp_pong, 20001);
    printf("ping %d\n", r);

    /* ping -- 20002 -> pong */
    send(jmp_ping, jmp_pong, 20002);
}

```

(continues on next page)

(continued from previous page)

```
}  
  
GEN_FUNC(pong) ()  
{  
    int r = 0;  
  
    /* pong -- 10001 -> ping */  
    send(jmp_pong, jmp_ping, 10001);  
    printf("pong %d\n", r);  
  
    /* pong -- 10002 -> ping */  
    send(jmp_pong, jmp_ping, 10002);  
    printf("pong %d\n", r);  
}  
  
int main(int argc, char *argv[])  
{  
    ping();  
    return 0;  
}
```

output:

```
$ ./a.out  
ping 10001  
pong 20001  
ping 10002  
pong 20002
```

## 13.10 Keyword Arguments in C

Python

```
>>> def f(str_, float_, int_=0):  
...     print(str_, float_, int_)  
...  
>>> f("KerKer", 2.0, 2)  
KerKer 2.0 2  
>>> f("HaHa", 3.)  
HaHa 3.0 0
```

C

```
#include <stdio.h>  
  
#define FUNC(...) \  
    base_func((struct input){.var=0, ##__VA_ARGS__});  
  
struct input {  
    char *str;  
    int var;  
    double dvar;  
};
```

(continues on next page)

(continued from previous page)

```

void base_func(struct input in){
    printf("str = %s, var = %d"
           ", dvar = %lf\n",
           in.str, in.var,in.dvar);
}

int main(int argc, char *argv[]) {
    FUNC(.str="KerKer", 2.0);
    FUNC(2, .str="KerKer");
    FUNC(.var=10, .dvar=2.0, .str="HAHA");
    return 0;
}

```

## 13.11 Function “MAP”

Python

```

>>> x = [1, 2, 3, 4, 5]
>>> y = map(lambda x: 2 * x, x)
>>> print(y)
[2, 4, 6, 8, 10]
#or
>>> x = [1, 2, 3, 4, 5]
>>> y = [2 * i for i in x]
>>> print(y)
[2, 4, 6, 8, 10]

```

C

```

#include <stdio.h>

#define MAP(func, src, dst, len) \
    do {\
        unsigned i=0;\
        for(i=0; i<len; i++) {\
            dst[i] = func(src[i]);\
        }\
    }while(0);

int multi2(int a) {
    return 2*a;
}

int main(int argc, char *argv[]) {
    int x[] = {1,2,3,4,5};
    int y[5] = {0};
    int i = 0;

    MAP(multi2, x, y, 5);
    for(i=0;i<5;i++) {
        printf("%d ",y[i]);
    }
}

```

(continues on next page)

(continued from previous page)

```
printf("\n");  
}
```

## 13.12 foreach in C

Python

```
>>> x = ["Hello", "World", "!!!"]  
>>> for i in x:  
...     print(i, end=' ')  
...  
Hello World !!! >>>
```

C

```
#include <stdio.h>  
  
#define foreach(it, x,...) \  
    for(char **it=x;*it;*it++) {__VA_ARGS__}  
  
int main(int argc, char *argv[]) {  
    char *x[] = {"Hello","World",  
                "!!!",NULL};  
    foreach(it,x,  
            printf("%s ",*it);  
    )  
    printf("\n");  
    return 0;  
}
```

## 13.13 Simple OOP in C

Python

```
# common declaration  
>>> class obj(object):  
...     def __init__(self):  
...         self.a = 0  
...         self.b = 0  
...     def add(self):  
...         return self.a + self.b  
...     def sub(self):  
...         return self.a - self.b  
...  
>>> o = obj()  
>>> o.a = 9527  
>>> o.b = 5566  
>>> o.add()  
15093  
>>> o.sub()  
3961
```

(continues on next page)

(continued from previous page)

```

# patch class (more like ooc)
>>> class obj(object):
...     def __init__(self):
...         self.a = 0
...         self.b = 0
...
>>> def add(self):
...     return self.a+self.b
...
>>> def sub(self):
...     return self.a - self.b
...
>>> obj.add = add
>>> obj.sub = sub
>>> o = obj()
>>> o.a = 9527
>>> o.b = 5566
>>> o.add()
15093
>>> o.sub()
3961

```

## C

```

#include <stdio.h>
#include <stdlib.h>

typedef struct object Obj;
typedef int (*func)(Obj *);

struct object {
    int a;
    int b;
    // virtual
    func add;
    func sub;
};

int add_func(Obj *self) {
    return self->a + self->b;
}

int sub_func(Obj *self) {
    return self->a - self->b;
}

int init_obj(Obj **self) {
    *self = malloc(sizeof(Obj));
    if (NULL == *self) {
        return -1;
    }
    (*self)->a = 0;
    (*self)->b = 0;
    (*self)->add = add_func;
    (*self)->sub = sub_func;
    return 0;
}

int main(int argc, char *argv[]) {
    Obj *o = NULL;

```

(continues on next page)

(continued from previous page)

```
init_obj(&o);
o->a = 9527;
o->b = 5566;
printf("add = %d\n", o->add(o));
printf("sub = %d\n", o->sub(o));
return 0;
}
```
