This is an unofficial Python wrapper for the [Binance exchange REST API v1/3](#). I am in no way affiliated with Binance, use at your own risk.

If you came here looking for the [Binance exchange](#) to purchase cryptocurrencies, then [go here](#). If you want to automate interactions with Binance stick around.

Source code <https://github.com/sammchardy/python-binance>

Documentation <https://python-binance.readthedocs.io/en/latest/>

Binance API Telegram https://t.me/binance_api_english

Blog with examples <https://sammchardy.github.io>

Make sure you update often and check the [Changelog](#) for new features and bug fixes.

CHAPTER 1

Features

- Implementation of all General, Market Data and Account endpoints.
- Simple handling of authentication
- No need to generate timestamps yourself, the wrapper does it for you
- Response exception handling
- Websocket handling with reconnection and multiplexed connections
- Symbol Depth Cache
- Historical Kline/Candle fetching function
- Withdraw functionality
- Deposit addresses

CHAPTER 2

Quick Start

Register an account with Binance.

Generate an API Key and assign relevant permissions.

```
pip install python-binance
```

```
from binance.client import Client
client = Client(api_key, api_secret)

# get market depth
depth = client.get_order_book(symbol='BNBBTC')

# place a test market buy order, to place an actual order use the create_order_
↳function
order = client.create_test_order(
    symbol='BNBBTC',
    side=Client.SIDE_BUY,
    type=Client.ORDER_TYPE_MARKET,
    quantity=100)

# get all symbol prices
prices = client.get_all_tickers()

# withdraw 100 ETH
# check docs for assumptions around withdrawals
from binance.exceptions import BinanceAPIException, BinanceWithdrawException
try:
    result = client.withdraw(
        asset='ETH',
        address='<eth_address>',
        amount=100)
except BinanceAPIException as e:
    print(e)
except BinanceWithdrawException as e:
```

(continues on next page)

```
    print(e)
else:
    print("Success")

# fetch list of withdrawals
withdraws = client.get_withdraw_history()

# fetch list of ETH withdrawals
eth_withdraws = client.get_withdraw_history(asset='ETH')

# get a deposit address for BTC
address = client.get_deposit_address(asset='BTC')

# start aggregated trade websocket for BNBBTC
def process_message(msg):
    print("message type: {}".format(msg['e']))
    print(msg)
    # do something

from binance.websockets import BinanceSocketManager
bm = BinanceSocketManager(client)
bm.start_aggrtrade_socket('BNBBTC', process_message)
bm.start()

# get historical kline data from any date range

# fetch 1 minute klines for the last day up until now
klines = client.get_historical_klines("BNBBTC", Client.KLINE_INTERVAL_1MINUTE, "1 day_
↪ago UTC")

# fetch 30 minute klines for the last month of 2017
klines = client.get_historical_klines("ETHBTC", Client.KLINE_INTERVAL_30MINUTE, "1_
↪Dec, 2017", "1 Jan, 2018")

# fetch weekly klines since it listed
klines = client.get_historical_klines("NEOBTC", Client.KLINE_INTERVAL_1WEEK, "1 Jan,_
↪2017")
```

For more check out the documentation.

CHAPTER 3

Donate

If this library helped you out feel free to donate.

- ETH: 0xD7a7fDdCfA687073d7cC93E9E51829a727f9fE70
- LTC: LPC5vw9ajR1YndE1hYVeo3kJ9LdHjcRCUZ
- NEO: AVJB4ZgN7VgSUtArCt94y7ZYT6d5NDfpBo
- BTC: 1Dknp6L6oRZrHDECRedihPzx2sSfmvEBys

If you use [Quoinex](#) or [Qryptos](#) check out my [python-quoine](#) library.

If you use [Kucoin](#) check out my [python-kucoin](#) library.

If you use [Allcoin](#) check out my [python-allucoin](#) library.

If you use [IDEX](#) check out my [python-idex](#) library.

If you use [BigONE](#) check out my [python-bigone](#) library.

4.1 Contents

4.1.1 Getting Started

Installation

`python-binance` is available on [PYPI](#). Install with `pip`:

```
pip install python-binance
```

Windows

If you see errors building `Twisted` indication Microsoft Visual C++ is required you may need to install the Visual C++ Build Tools refer to the [Python Wiki on Windows Compilers](#) for your relevant version.

Register on Binance

Firstly register an account with [Binance](#).

Generate an API Key

To use signed account methods you are required to [create an API Key](#).

Initialise the client

Pass your API Key and Secret

```
from binance.client import Client
client = Client(api_key, api_secret)
```

Making API Calls

Every method supports the passing of arbitrary parameters via keyword matching those in the 'Binance API documentation' <<https://github.com/binance-exchange/binance-official-api-docs>>'. These keyword arguments will be sent directly to the relevant endpoint.

Each API method returns a dictionary of the JSON response as per the [Binance API documentation](#). The docstring of each method in the code references the endpoint it implements.

The Binance API documentation references a *timestamp* parameter, this is generated for you where required.

Some methods have a *recvWindow* parameter for [timing security](#), see [Binance documentation](#).

API Endpoints are rate limited by Binance at 20 requests per second, ask them if you require more.

API Rate Limit

Check the `get_exchange_info()` call for up to date rate limits.

At the current time Binance rate limits are:

- 1200 requests per minute
- 10 orders per second
- 100,000 orders per 24hrs

Some calls have a higher weight than others especially if a call returns information about all symbols. Read the '[official Binance documentation](#) <<https://github.com/binance-exchange/binance-official-api-docs>>' for specific information.

Requests Settings

python-binance uses the [requests](#) library.

You can set custom requests parameters for all API calls when creating the client.

```
client = Client("api-key", "api-secret", {"verify": False, "timeout": 20})
```

You may also pass custom requests parameters through any API call to override default settings or the above settings specify new ones like the example below.

```
# this would result in verify: False and timeout: 5 for the get_all_orders call
client = Client("api-key", "api-secret", {"verify": False, "timeout": 20})
client.get_all_orders(symbol='BNBBTC', requests_params={'timeout': 5})
```

Check out the [requests documentation](#) for all options.

Proxy Settings

You can use the Requests Settings method above

```
proxies = {
    'http': 'http://10.10.1.10:3128',
    'https': 'http://10.10.1.10:1080'
}

# in the Client instantiation
client = Client("api-key", "api-secret", {'proxies': proxies})

# or on an individual call
client.get_all_orders(symbol='BNBBTC', requests_params={'proxies': proxies})
```

Or set an environment variable for your proxy if required to work across all requests.

An example for Linux environments from the [requests Proxies documentation](#) is as follows.

```
$ export HTTP_PROXY="http://10.10.1.10:3128"
$ export HTTPS_PROXY="http://10.10.1.10:1080"
```

For Windows environments

```
C:\>set HTTP_PROXY=http://10.10.1.10:3128
C:\>set HTTPS_PROXY=http://10.10.1.10:1080
```

4.1.2 Binance Constants

Binance requires specific string constants for Order Types, Order Side, Time in Force, Order response and Kline intervals these are found on *binance.client.Client*.

```
SYMBOL_TYPE_SPOT = 'SPOT'

ORDER_STATUS_NEW = 'NEW'
ORDER_STATUS_PARTIALLY_FILLED = 'PARTIALLY_FILLED'
ORDER_STATUS_FILLED = 'FILLED'
ORDER_STATUS_CANCELED = 'CANCELED'
ORDER_STATUS_PENDING_CANCEL = 'PENDING_CANCEL'
ORDER_STATUS_REJECTED = 'REJECTED'
ORDER_STATUS_EXPIRED = 'EXPIRED'

KLINE_INTERVAL_1MINUTE = '1m'
KLINE_INTERVAL_3MINUTE = '3m'
KLINE_INTERVAL_5MINUTE = '5m'
KLINE_INTERVAL_15MINUTE = '15m'
KLINE_INTERVAL_30MINUTE = '30m'
KLINE_INTERVAL_1HOUR = '1h'
KLINE_INTERVAL_2HOUR = '2h'
KLINE_INTERVAL_4HOUR = '4h'
```

(continues on next page)

(continued from previous page)

```
KLINE_INTERVAL_6HOUR = '6h'
KLINE_INTERVAL_8HOUR = '8h'
KLINE_INTERVAL_12HOUR = '12h'
KLINE_INTERVAL_1DAY = '1d'
KLINE_INTERVAL_3DAY = '3d'
KLINE_INTERVAL_1WEEK = '1w'
KLINE_INTERVAL_1MONTH = '1M'

SIDE_BUY = 'BUY'
SIDE_SELL = 'SELL'

ORDER_TYPE_LIMIT = 'LIMIT'
ORDER_TYPE_MARKET = 'MARKET'
ORDER_TYPE_STOP_LOSS = 'STOP_LOSS'
ORDER_TYPE_STOP_LOSS_LIMIT = 'STOP_LOSS_LIMIT'
ORDER_TYPE_TAKE_PROFIT = 'TAKE_PROFIT'
ORDER_TYPE_TAKE_PROFIT_LIMIT = 'TAKE_PROFIT_LIMIT'
ORDER_TYPE_LIMIT_MAKER = 'LIMIT_MAKER'

TIME_IN_FORCE_GTC = 'GTC'
TIME_IN_FORCE_IOC = 'IOC'
TIME_IN_FORCE_FOK = 'FOK'

ORDER_RESP_TYPE_ACK = 'ACK'
ORDER_RESP_TYPE_RESULT = 'RESULT'
ORDER_RESP_TYPE_FULL = 'FULL'

# For accessing the data returned by Client.aggregate_trades().
AGG_ID = 'a'
AGG_PRICE = 'p'
AGG_QUANTITY = 'q'
AGG_FIRST_TRADE_ID = 'f'
AGG_LAST_TRADE_ID = 'l'
AGG_TIME = 'T'
AGG_BUYER_MAKES = 'm'
AGG_BEST_MATCH = 'M'
```

For Websocket Depth these are found on *binance.websockets.BinanceSocketManager*

```
WEBSOCKET_DEPTH_5 = '5'
WEBSOCKET_DEPTH_10 = '10'
WEBSOCKET_DEPTH_20 = '20'
```

To use in your code reference either *binance.client.Client* or *binance.websockets.BinanceSocketManager*

```
from binance.client import Client
from binance.websockets import BinanceSocketManager

side = Client.SIDE_BUY
```

4.1.3 General Endpoints

Ping the server

```
client.ping()
```

Get the server time

```
time_res = client.get_server_time()
```

Get system status

```
status = client.get_system_status()
```

Returns

```
{
    "status": 0,          # 0: normal system maintenance
    "msg": "normal"     # normal or System maintenance.
}
```

Get Exchange Info

```
info = client.get_exchange_info()
```

Get Symbol Info

Get the exchange info for a particular symbol

```
info = client.get_symbol_info('BNBBTC')
```

Get Current Products

This call is deprecated, use the above Exchange Info call

```
products = client.get_products()
```

4.1.4 Market Data Endpoints

Get Market Depth

```
depth = client.get_order_book(symbol='BNBBTC')
```

Get Recent Trades

```
trades = client.get_recent_trades(symbol='BNBBTC')
```

Get Historical Trades

```
trades = client.get_historical_trades(symbol='BNBBTC')
```

Get Aggregate Trades

```
trades = client.get_aggregate_trades(symbol='BNBBTC')
```

Aggregate Trade Iterator

Iterate over aggregate trades for a symbol from a given date or a given order id.

```
agg_trades = client.aggregate_trade_iter(symbol='ETHBTC', start_str='30 minutes ago_
↳UTC')

# iterate over the trade iterator
for trade in agg_trades:
    print(trade)
    # do something with the trade data

# convert the iterator to a list
# note: generators can only be iterated over once so we need to call it again
agg_trades = client.aggregate_trade_iter(symbol='ETHBTC', '30 minutes ago UTC')
agg_trade_list = list(agg_trades)

# example using last_id value
agg_trades = client.aggregate_trade_iter(symbol='ETHBTC', last_id=23380478)
agg_trade_list = list(agg_trades)
```

Get Kline/Candlesticks

```
candles = client.get_klines(symbol='BNBBTC', interval=Client.KLINE_INTERVAL_30MINUTE)
```

Get Historical Kline/Candlesticks

Fetch klines for any date range and interval

```
# fetch 1 minute klines for the last day up until now
klines = client.get_historical_klines("BNBBTC", Client.KLINE_INTERVAL_1MINUTE, "1 day_
↳ago UTC")

# fetch 30 minute klines for the last month of 2017
klines = client.get_historical_klines("ETHBTC", Client.KLINE_INTERVAL_30MINUTE, "1_
↳Dec, 2017", "1 Jan, 2018")
```

(continues on next page)

(continued from previous page)

```
# fetch weekly klines since it listed
klines = client.get_historical_klines("NEOBTC", KLINE_INTERVAL_1WEEK, "1 Jan, 2017")
```

Get Historical Kline/Candlesticks using a generator

Fetch klines using a generator

```
for kline in client.get_historical_klines_generator("BNBBTC", Client.KLINE_INTERVAL_
↪1MINUTE, "1 day ago UTC"):
    print(kline)
    # do something with the kline
```

Get 24hr Ticker

```
tickers = client.get_ticker()
```

Get All Prices

Get last price for all markets.

```
prices = client.get_all_tickers()
```

Get Orderbook Tickers

Get first bid and ask entry in the order book for all markets.

```
tickers = client.get_orderbook_tickers()
```

4.1.5 Account Endpoints

Orders

Order Validation

Binance has a number of rules around symbol pair orders with validation on minimum price, quantity and total order value.

Read more about their specifics in the [Filters](#) section of the official API.

It can be helpful to format the output using the following snippet

```
amount = 0.000234234
precision = 5
amt_str = "{:0.0{}}f".format(amount, precision)
```

Fetch all orders

```
orders = client.get_all_orders(symbol='BNBBTC', limit=10)
```

Place an order

Place an order

Use the `create_order` function to have full control over creating an order

```
from binance.enums import *
order = client.create_order(
    symbol='BNBBTC',
    side=SIDE_BUY,
    type=ORDER_TYPE_LIMIT,
    timeInForce=TIME_IN_FORCE_GTC,
    quantity=100,
    price='0.00001')
```

Place a limit order

Use the helper functions to easily place a limit buy or sell order

```
order = client.order_limit_buy(
    symbol='BNBBTC',
    quantity=100,
    price='0.00001')

order = client.order_limit_sell(
    symbol='BNBBTC',
    quantity=100,
    price='0.00001')
```

Place a market order

Use the helper functions to easily place a market buy or sell order

```
order = client.order_market_buy(
    symbol='BNBBTC',
    quantity=100)

order = client.order_market_sell(
    symbol='BNBBTC',
    quantity=100)
```

Place a test order

Creates and validates a new order but does not send it into the exchange.

```
from binance.enums import *
order = client.create_test_order(
    symbol='BNBBTC',
    side=SIDE_BUY,
    type=ORDER_TYPE_LIMIT,
```

(continues on next page)

(continued from previous page)

```
timeInForce=TIME_IN_FORCE_GTC,  
quantity=100,  
price='0.00001')
```

Check order status

```
order = client.get_order(  
    symbol='BNBBTC',  
    orderId='orderId')
```

Cancel an order

```
result = client.cancel_order(  
    symbol='BNBBTC',  
    orderId='orderId')
```

Get all open orders

```
orders = client.get_open_orders(symbol='BNBBTC')
```

Get all orders

```
orders = client.get_all_orders(symbol='BNBBTC')
```

Account

Get account info

```
info = client.get_account()
```

Get asset balance

```
balance = client.get_asset_balance(asset='BTC')
```

Get account status

```
status = client.get_account_status()
```

Get trades

```
trades = client.get_my_trades(symbol='BNBBTC')
```

Get trade fees

```
# get fees for all symbols
fees = client.get_trade_fee()

# get fee for one symbol
fees = client.get_trade_fee(symbol='BNBBTC')
```

Get asset details

```
details = client.get_asset_details()
```

Get dust log

```
log = client.get_dust_log()
```

4.1.6 Websockets

Sockets are handled through a Socket Manager [BinanceSocketManager](#).

Multiple socket connections can be made through the manager.

Only one instance of each socket type will be created, i.e. only one BNBBTC Depth socket can be created and there can be both a BNBBTC Depth and a BNBBTC Trade socket open at once.

When creating socket connections a callback function is passed which receives the messages.

Messages are received as dictionary objects relating to the message formats defined in the [Binance WebSocket API documentation](#).

Websockets are setup to reconnect with a maximum of 5 retries.

WebSocket Usage

Create the manager like so, passing the API client.

```
from binance.websockets import BinanceSocketManager
bm = BinanceSocketManager(client)
# start any sockets here, i.e a trade socket
conn_key = bm.start_trade_socket('BNBBTC', process_message)
# then start the socket manager
bm.start()
```

A callback to process messages would take the format

```
def process_message(msg):
    print("message type: {}".format(msg['e']))
    print(msg)
    # do something
```

Set a custom timeout for the websocket connection

```
# set a timeout of 60 seconds
bm = BinanceSocketManager(client, user_timeout=60)
```

Websocket Errors

If the websocket is disconnected and is unable to reconnect a message is sent to the callback to indicate this. The format is

```
{
    'e': 'error',
    'm': 'Max reconnect retries reached'
}

# check for it like so
def process_message(msg):
    if msg['e'] == 'error':
        # close and restart the socket
    else:
        # process message normally
```

Multiplex Socket

Create a socket combining multiple streams.

These streams can include the depth, kline, ticker and trade streams but not the user stream which requires extra authentication.

Symbols in socket name must be lowercase i.e `bnbtc@aggTrade`, `neobtc@ticker`

See the [Binance Websocket Streams API documentation](#) for details on socket names.

```
def process_m_message(msg):
    print("stream: {} data: {}".format(msg['stream'], msg['data']))

# pass a list of stream names
conn_key = bm.start_multiplex_socket(['bnbtc@aggTrade', 'neobtc@ticker'], process_m_
↪message)
```

Depth Socket

Depth sockets have an optional depth parameter to receive partial book rather than a diff response. By default this the diff response is returned. Valid depth values are 5, 10 and 20 and defined as enums.

```
# depth diff response
diff_key = bm.start_depth_socket('BNBBTC', process_message)
```

(continues on next page)

(continued from previous page)

```
# partial book response
partial_key = bm.start_depth_socket('BNBBTC', process_message,
↳depth=BinanceSocketManager.WEBSOCKET_DEPTH_5)
```

Kline Socket

Kline sockets have an optional interval parameter. By default this is set to 1 minute. Valid interval values are defined as enums.

```
from binance.enums import *
conn_key = bm.start_kline_socket('BNBBTC', process_message, interval=KLINE_INTERVAL_
↳30MINUTE)
```

Aggregated Trade Socket

```
conn_key = bm.start_agtrade_socket('BNBBTC', process_message)
```

Trade Socket

```
conn_key = bm.start_trade_socket('BNBBTC', process_message)
```

Symbol Ticker Socket

```
conn_key = bm.start_symbol_ticker_socket('BNBBTC', process_message)
```

Ticker Socket

```
conn_key = bm.start_ticker_socket(process_message)
```

Mini Ticker Socket

```
# by default updates every second
conn_key = bm.start_miniticker_socket(process_message)

# this socket can take an update interval parameter
# set as 5000 to receive updates every 5 seconds
conn_key = bm.start_miniticker_socket(process_message, 5000)
```

User Socket

This watches for 3 different user events

- Account Update Event

- Order Update Event
- Trade Update Event

The Manager handles keeping the socket alive.

```
bm.start_user_socket(process_message)
```

Close a Socket

To close an individual socket call the *stop_socket* function. This takes a *conn_key* parameter which is returned when starting the socket.

```
bm.stop_socket(conn_key)
```

To stop all sockets and end the manager call *close* after doing this a *start* call would be required to connect any new sockets.

```
bm.close()
```

Close and exit program

Websockets utilise a reactor loop from the Twisted library. Using the *close* method above will close the websocket connections but it won't stop the reactor loop so your code may not exit when you expect.

If you do want to exit then use the *stop* method from reactor like below.

```
from twisted.internet import reactor

# program code here

# when you need to exit
reactor.stop()
```

4.1.7 Depth Cache

To follow the depth cache updates for a symbol use the *DepthCacheManager*

Create the manager like so, passing the api client, symbol and an optional callback function.

```
from binance.depthcache import DepthCacheManager
dcm = DepthCacheManager(client, 'BNBBTC', callback=process_depth)
```

The callback function receives the current *DepthCache* object which allows access to a pre-sorted list of bids or asks able to be filtered as required.

Access the symbol value from the *depth_cache* object in case you have multiple caches using the same callback.

By default the depth cache will fetch the order book via REST request every 30 minutes. This duration can be changed by using the *refresh_interval* parameter. To disable the refresh pass 0 or None. The socket connection will stay open receiving updates to be replayed once the full order book is received.

Share a Socket Manager

Here dcm1 and dcm2 share the same instance of BinanceSocketManager

```
from binance.websockets import BinanceSocketManager
from binance.depthcache import DepthCacheManager
bm = BinanceSocketManager(client)
dcm1 = DepthCacheManager(client, 'BNBBTC', callback=process_depth1, bm=bm)
dcm2 = DepthCacheManager(client, 'ETHBTC', callback=process_depth2, bm=bm)
```

Because they both share the same BinanceSocketManager calling close can close both message streams.

```
# close just dcm1 stream
dcm1.close()

# close the underlying socket manager as well
dcm1.close(close_socket=True)
```

Websocket Errors

If the underlying websocket is disconnected and is unable to reconnect None is returned for the depth_cache parameter.

Examples

```
# 1 hour interval refresh
dcm = DepthCacheManager(client, 'BNBBTC', callback=process_depth, refresh_
↪interval=60*60)

# disable refreshing
dcm = DepthCacheManager(client, 'BNBBTC', callback=process_depth, refresh_interval=0)
```

```
def process_depth(depth_cache):
    if depth_cache is not None:
        print("symbol {}".format(depth_cache.symbol))
        print("top 5 bids")
        print(depth_cache.get_bids()[:5])
        print("top 5 asks")
        print(depth_cache.get_asks()[:5])
    else:
        # depth cache had an error and needs to be restarted
```

At any time the current *DepthCache* object can be retrieved from the *DepthCacheManager*

```
depth_cache = dcm.get_depth_cache()
if depth_cache is not None:
    print("symbol {}".format(depth_cache.symbol))
    print("top 5 bids")
    print(depth_cache.get_bids()[:5])
    print("top 5 asks")
    print(depth_cache.get_asks()[:5])
else:
    # depth cache had an error and needs to be restarted
```

To stop the *DepthCacheManager* from returning messages use the *close* method. This will close the internal websocket and this instance of the *DepthCacheManager* will not be able to be used again.

```
dcm.close()
```

4.1.8 Withdraw Endpoints

Place a withdrawal

Make sure you enable Withdrawal permissions for your API Key to use this call.

You must have withdrawn to the address through the website and approved the withdrawal via email before you can withdraw using the API.

Raises a `BinanceWithdrawException` if the withdraw fails.

```
from binance.exceptions import BinanceAPIException, BinanceWithdrawException
try:
    # name parameter will be set to the asset value by the client if not passed
    result = client.withdraw(
        asset='ETH',
        address='<eth_address>',
        amount=100)
except BinanceAPIException as e:
    print(e)
except BinanceWithdrawException as e:
    print(e)
else:
    print("Success")

# passing a name parameter
result = client.withdraw(
    asset='ETH',
    address='<eth_address>',
    amount=100,
    name='Withdraw')

# if the coin requires a extra tag or name such as XRP or XMR then pass an
↪ `addressTag` parameter.
result = client.withdraw(
    asset='XRP',
    address='<xrp_address>',
    addressTag='<xrp_address_tag>',
    amount=10000)
```

Fetch deposit history

```
deposits = client.get_deposit_history()
btc_deposits = client.get_deposit_history(asset='BTC')
```

Fetch withdraw history

```
withdraws = client.get_withdraw_history()
btc_withdraws = client.get_withdraw_history(asset='BTC')
```

Get deposit address

```
address = client.get_deposit_address(asset='BTC')
```

Get withdraw fee

```
address = client.get_withdraw_fee(asset='BTC')
```

4.1.9 Helper Functions

`binance.helpers`

alias of `binance.helpers`

4.1.10 Exceptions

BinanceRequestException

Raised if a non JSON response is returned

BinanceAPIException

On an API call error a `binance.exceptions.BinanceAPIException` will be raised.

The exception provides access to the

- `status_code` - response status code
- `response` - response object
- `code` - Binance error code
- `message` - Binance error message
- `request` - request object if available

```
try:
    client.get_all_orders()
except BinanceAPIException as e:
    print e.status_code
    print e.message
```

BinanceWithdrawException

Raised if the withdraw fails.

4.1.11 FAQ

Q: Why do I get “Timestamp for this request is not valid”

A: This occurs in 2 different cases.

The timestamp sent is outside of the serverTime - recvWindow value The timestamp sent is more than 1000ms ahead of the server time

Check that your system time is in sync. See [this issue](#) for some sample code to check the difference between your local time and the Binance server time.

Q: Why do I get “Signature for this request is not valid”

A1: One of your parameters may not be in the correct format.

Check recvWindow is an integer and not a string.

A2: You may need to regenerate your API Key and Secret

A3: You may be attempting to access the API from a Chinese IP address, these are now restricted by Binance.

Q: Twisted won't install using pip on Windows

A: If you see errors building Twisted indication Microsoft Visual C++ is required you may need to install the Visual C++ Build Tools refer to the [Python Wiki on Windows Compilers](#) for your relevant version.

4.1.12 Changelog

v0.7.0 - 2018-08-08

Added

- get_asset_details endpoint
- get_dust_log endpoint
- get_trade_fee endpoint
- ability for multiple DepthCacheManagers to share a BinanceSocketManager
- get_historical_klines_generator function
- custom socket timeout param for BinanceSocketManager

Updated

- general dependency version
- removed support for python3.3

Fixed

- add a super init on BinanceClientProtocol

v0.6.9 - 2018-04-27

Added

- timestamp in milliseconds to *get_historical_klines* function
- timestamp in milliseconds to *aggregate_trade_iter* function

Fixed

- Don't close user stream listen key on socket close

v0.6.8 - 2018-03-29

Added

- *get_withdraw_fee* function

Fixed

- Remove unused LISTENKEY_NOT_EXISTS
- Optimise the historical klines function to reduce requests
- Issue with end_time in aggregate trade iterator

v0.6.7 - 2018-03-14

Fixed

- Issue with *get_historical_klines* when response had exactly 500 results
- Changed BinanceResponseException to BinanceRequestException
- Set default code value in BinanceApiException properly

v0.6.6 - 2018-02-17

Fixed

- User stream websocket keep alive strategy updated

v0.6.5 - 2018-02-13

Fixed

- *get_historical_klines* response for month interval

v0.6.4 - 2018-02-09

Added

- system status endpoint *get_system_status*

v0.6.3 - 2018-01-29

Added

- mini ticker socket function *start_miniticker_socket*
- aggregate trade iterator *aggregate_trade_iter*

Fixes

- clean up *interval_to_milliseconds* logic
- general doc and file cleanups

v0.6.2 - 2018-01-12

Fixes

- fixed handling Binance errors that aren't JSON objects

v0.6.1 - 2018-01-10

Fixes

- added missing dateparser dependency to setup.py
- documentation fixes

v0.6.0 - 2018-01-09

New version because why not.

Added

- `get_historical_klines` function to fetch klines for any date range
- ability to override requests parameters globally
- error on websocket disconnect
- example related to blog post

Fixes

- documentation fixes

v0.5.17 - 2018-01-08

Added

- check for name parameter in `withdraw`, set to asset parameter if not passed

Update

- Windows install error documentation

Removed

- reference to `disable_validation` in documentation

v0.5.16 - 2018-01-06

Added

- `addressTag` documentation to `withdraw` function
- documentation about requests proxy environment variables

Update

- FAQ for signature error with solution to regenerate API key
- change `create_order` to `create_test_order` in example

Fixed

- reference to BinanceAPIException in documentation

v0.5.15 - 2018-01-03

Fixed

- removed all references to WEBSOCKET_DEPTH_1 enum

v0.5.14 - 2018-01-02

Added

- Wait for depth cache socket to start
- check for sequential depth cache messages

Updated

- documentation around depth websocket and diff and partial responses

Removed

- Removed unused WEBSOCKET_DEPTH_1 enum
- removed unused libraries and imports

v0.5.13 - 2018-01-01

Fixed

- Signature invalid error

v0.5.12 - 2017-12-29

Added

- get_asset_balance helper function to fetch an individual asset's balance

Fixed

- added timeout to requests call to prevent hanging
- changed variable type to str for price parameter when creating an order
- documentation fixes

v0.5.11 - 2017-12-28

Added

- refresh interval parameter to depth cache to keep it fresh, set default at 30 minutes

Fixed

- watch depth cache socket before fetching order book to replay any messages

v0.5.10 - 2017-12-28

Updated

- updated dependencies certifi and cryptography to help resolve signature error

v0.5.9 - 2017-12-26

Fixed

- fixed websocket reconnecting, was no distinction between manual close or network error

v0.5.8 - 2017-12-25

Changed

- change symbol parameter to optional for get_open_orders function
- added listenKey parameter to stream_close function

Added

- get_account_status function that was missed

v0.5.7 - 2017-12-24

Changed

- change depth cache callback parameter to optional

Added

- note about stopping Twisted reactor loop to exit program

v0.5.6 - 2017-12-20

Added

- get_symbol_info function to simplify getting info about a particular symbol

v0.5.5 - 2017-12-19

Changed

- Increased default limit for order book on depth cache from 10 to 500

v0.5.4 - 2017-12-14

Added

- symbol property made public on DepthCache class

Changed

- Enums now also accessible from binance.client.Client and binance.websockets.BinanceSocketManager

v0.5.3 - 2017-12-09

Changed

- User stream refresh timeout from 50 minutes to 30 minutes
- User stream socket listen key change check simplified

v0.5.2 - 2017-12-08

Added

- start_multiplex_socket function to BinanceSocketManager to create multiplexed streams

v0.5.1 - 2017-12-06

Added

- Close method for DepthCacheManager

Fixes

- Fixed modifying array error message when closing the BinanceSocketManager

v0.5.0 - 2017-12-05

Updating to match new API documentation

Added

- Recent trades endpoint
- Historical trades endpoint
- Order response type option
- Check for invalid user stream listen key in socket to keep connected

Fixes

- Fixed exchange info endpoint as it was renamed slightly

v0.4.3 - 2017-12-04

Fixes

- Fixed stopping sockets where they were reconnecting
- Fixed websockets unable to be restarted after close
- Exception in parsing non-JSON websocket message

v0.4.2 - 2017-11-30

Removed

- Removed websocket update time as 0ms option is not available

v0.4.1 - 2017-11-24

Added

- Reconnecting websockets, automatic retry on disconnect

v0.4.0 - 2017-11-19

Added

- Get deposit address endpoint
- Upgraded withdraw endpoints to v3
- New exchange info endpoint with rate limits and full symbol info

Removed

- Order validation to return at a later date

v0.3.8 - 2017-11-17

Fixes

- Fix order validation for market orders
- WEBSOCKET_DEPTH_20 value, 20 instead of 5
- General tidy up

v0.3.7 - 2017-11-16

Fixes

- Fix multiple depth caches sharing a cache by initialising bid and ask objects each time

v0.3.6 - 2017-11-15

Fixes

- check if Reactor is already running

v0.3.5 - 2017-11-06

Added

- support for BNB market

Fixes

- fixed error if new market type is created that we don't know about

v0.3.4 - 2017-10-31

Added

- depth parameter to depth socket
- interval parameter to kline socket
- update time parameter for compatible sockets
- new enums for socket depth and update time values
- better websocket documentation

Changed

- Depth Cache Manager uses 0ms socket update time
- connection key returned when creating socket, this key is then used to stop it

Fixes

- General fixes

v0.3.3 - 2017-10-31

Fixes

- Fixes for broken tests

v0.3.2 - 2017-10-30

Added

- More test coverage of requests

Fixes

- Order quantity validation fix

v0.3.1 - 2017-10-29

Added

- Withdraw exception handler with translation of obscure error

Fixes

- Validation fixes

v0.3.0 - 2017-10-29

Added

- Withdraw endpoints
- Order helper functions

v0.2.0 - 2017-10-27

Added

- Symbol Depth Cache

v0.1.6 - 2017-10-25

Changes

- Upgrade to v3 signed endpoints
- Update function documentation

v0.1.5 - 2017-09-12

Changes

- Added get_all_tickers call
- Added get_orderbook_tickers call
- Added some FAQs

Fixes

- Fix error in enum value

v0.1.4 - 2017-09-06

Changes

- Added parameter to disable client side order validation

v0.1.3 - 2017-08-26

Changes

- Updated documentation

Fixes

- Small bugfix

v0.1.2 - 2017-08-25

Added

- Travis.CI and Coveralls support

Changes

- Validation for pairs using public endpoint

v0.1.1 - 2017-08-17

Added

- Validation for HSR/BTC pair

v0.1.0 - 2017-08-16

Websocket release

Added

- Websocket manager
- Order parameter validation
- Order and Symbol enums
- API Endpoints for Data Streams

v0.0.2 - 2017-08-14

Initial version

Added

- General, Market Data and Account endpoints

4.1.13 Binance API

client module

```
class binance.client.Client (api_key, api_secret, requests_params=None)
    Bases: object

```

```
WITHDRAW_API_VERSION = 'v3'
```

```
__init__(api_key, api_secret, requests_params=None)
```

Binance API Client constructor

Parameters

- **api_key** (*str.*) – Api Key
- **api_secret** (*str.*) – Api Secret
- **requests_params** (*dict.*) – optional - Dictionary of requests params to use for all calls

```
aggregate_trade_iter(symbol, start_str=None, last_id=None)
```

Iterate over aggregate trade data from (start_time or last_id) to the end of the history so far.

If start_time is specified, start with the first trade after start_time. Meant to initialise a local cache of trade data.

If last_id is specified, start with the trade after it. This is meant for updating a pre-existing local trade data cache.

Only allows start_str or last_id—not both. Not guaranteed to work right if you’re running more than one of these simultaneously. You will probably hit your rate limit.

See dateparser docs for valid start and end string formats <http://dateparser.readthedocs.io/en/latest/>

If using offset strings for dates add “UTC” to date string e.g. “now UTC”, “11 hours ago UTC”

Parameters

- **symbol** (*str*) – Symbol string e.g. ETHBTC
- **start_str** – Start date string in UTC format or timestamp in milliseconds. The iterator will

return the first trade occurring later than this time. :type start_str: str lint :param last_id: aggregate trade ID of the last known aggregate trade. Not a regular trade ID. See <https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#compressedaggregate-trades-list>.

Returns an iterator of JSON objects, one per trade. The format of each object is identical to Client.aggregate_trades().

```
cancel_order(**params)
```

Cancel an active order. Either orderId or origClientId must be sent.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#cancel-order-trade>

Parameters

- **symbol** (*str*) – required
- **orderId** (*int*) – The unique order id
- **origClientId** (*str*) – optional
- **newClientId** (*str*) – Used to uniquely identify this cancel. Automatically generated by default.
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

```
{
  "symbol": "LTCBTC",
  "origClientOrderId": "myOrder1",
  "orderId": 1,
  "clientOrderId": "cancelMyOrder1"
}
```

Raises BinanceRequestException, BinanceAPIException

create_order (**params)

Send in a new order

Any order with an icebergQty MUST have timeInForce set to GTC.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#new-order-trade>

Parameters

- **symbol** (*str*) – required
- **side** (*str*) – required
- **type** (*str*) – required
- **timeInForce** (*str*) – required if limit order
- **quantity** (*decimal*) – required
- **price** (*str*) – required
- **newClientOrderId** (*str*) – A unique id for the order. Automatically generated if not sent.
- **icebergQty** (*decimal*) – Used with LIMIT, STOP_LOSS_LIMIT, and TAKE_PROFIT_LIMIT to create an iceberg order.
- **newOrderRespType** (*str*) – Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

Response ACK:

```
{
  "symbol": "LTCBTC",
  "orderId": 1,
  "clientOrderId": "myOrder1" # Will be newClientOrderId
  "transactTime": 1499827319559
}
```

Response RESULT:

```
{
  "symbol": "BTCUSDT",
  "orderId": 28,
  "clientOrderId": "6gCrw2kRUAF9CvJDGP16IP",
  "transactTime": 1507725176595,
  "price": "0.00000000",
}
```

(continues on next page)

(continued from previous page)

```
"origQty": "10.00000000",
"executedQty": "10.00000000",
"status": "FILLED",
"timeInForce": "GTC",
"type": "MARKET",
"side": "SELL"
}
```

Response FULL:

```
{
  "symbol": "BTCUSDT",
  "orderId": 28,
  "clientOrderId": "6gCrw2kRUAf9CvJDGP16IP",
  "transactTime": 1507725176595,
  "price": "0.00000000",
  "origQty": "10.00000000",
  "executedQty": "10.00000000",
  "status": "FILLED",
  "timeInForce": "GTC",
  "type": "MARKET",
  "side": "SELL",
  "fills": [
    {
      "price": "4000.00000000",
      "qty": "1.00000000",
      "commission": "4.00000000",
      "commissionAsset": "USDT"
    },
    {
      "price": "3999.00000000",
      "qty": "5.00000000",
      "commission": "19.99500000",
      "commissionAsset": "USDT"
    },
    {
      "price": "3998.00000000",
      "qty": "2.00000000",
      "commission": "7.99600000",
      "commissionAsset": "USDT"
    },
    {
      "price": "3997.00000000",
      "qty": "1.00000000",
      "commission": "3.99700000",
      "commissionAsset": "USDT"
    },
    {
      "price": "3995.00000000",
      "qty": "1.00000000",
      "commission": "3.99500000",
      "commissionAsset": "USDT"
    }
  ]
}
```

Raises `BinanceRequestException`, `BinanceAPIException`, `BinanceOrderException`, `BinanceOr-`

derMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

create_test_order (**params)

Test new order creation and signature/recvWindow long. Creates and validates a new order but does not send it into the matching engine.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#test-new-order-trade>

Parameters

- **symbol** (*str*) – required
- **side** (*str*) – required
- **type** (*str*) – required
- **timeInForce** (*str*) – required if limit order
- **quantity** (*decimal*) – required
- **price** (*str*) – required
- **newClientOrderId** (*str*) – A unique id for the order. Automatically generated if not sent.
- **icebergQty** (*decimal*) – Used with iceberg orders
- **newOrderRespType** (*str*) – Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- **recvWindow** (*int*) – The number of milliseconds the request is valid for

Returns API response

```
{}
```

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

get_account (**params)

Get current account information.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#account-information-user_data

Parameters **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

```
{
  "makerCommission": 15,
  "takerCommission": 15,
  "buyerCommission": 0,
  "sellerCommission": 0,
  "canTrade": true,
  "canWithdraw": true,
  "canDeposit": true,
  "balances": [
    {
```

(continues on next page)

(continued from previous page)

```

        "asset": "BTC",
        "free": "4723846.89208129",
        "locked": "0.00000000"
    },
    {
        "asset": "LTC",
        "free": "4763368.68006011",
        "locked": "0.00000000"
    }
]
}

```

Raises `BinanceRequestException`, `BinanceAPIException`

get_account_status (**params)

Get account status detail.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/wapi-api.md#account-status-user_data

Parameters `recvWindow` (*int*) – the number of milliseconds the request is valid for

Returns API response

```

{
  "msg": "Order failed:Low Order fill rate! Will be reactivated after 5_
↪minutes.",
  "success": true,
  "objs": [
    "5"
  ]
}

```

Raises `BinanceWithdrawException`

get_aggregate_trades (**params)

Get compressed, aggregate trades. Trades that fill at the time, from the same order, with the same price will have the quantity aggregated.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#compressedaggregate-trades-list>

Parameters

- **symbol** (*str*) – required
- **fromId** (*str*) – ID to get aggregate trades from INCLUSIVE.
- **startTime** (*int*) – Timestamp in ms to get aggregate trades from INCLUSIVE.
- **endTime** (*int*) – Timestamp in ms to get aggregate trades until INCLUSIVE.
- **limit** (*int*) – Default 500; max 500.

Returns API response

```

[
  {
    "a": 26129,           # Aggregate tradeId

```

(continues on next page)

(continued from previous page)

```

    "p": "0.01633102", # Price
    "q": "4.70443515", # Quantity
    "f": 27781,       # First tradeId
    "l": 27781,       # Last tradeId
    "T": 1498793709153, # Timestamp
    "m": true,        # Was the buyer the maker?
    "M": true         # Was the trade the best price match?
  }
]

```

Raises BinanceRequestException, BinanceAPIException

get_all_orders (**params)

Get all account orders; active, canceled, or filled.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#all-orders-user-data>

Parameters

- **symbol** (*str*) – required
- **orderId** (*int*) – The unique order id
- **limit** (*int*) – Default 500; max 500.
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

```

[
  {
    "symbol": "LTCBTC",
    "orderId": 1,
    "clientOrderId": "myOrder1",
    "price": "0.1",
    "origQty": "1.0",
    "executedQty": "0.0",
    "status": "NEW",
    "timeInForce": "GTC",
    "type": "LIMIT",
    "side": "BUY",
    "stopPrice": "0.0",
    "icebergQty": "0.0",
    "time": 1499827319559
  }
]

```

Raises BinanceRequestException, BinanceAPIException

get_all_tickers ()

Latest price for all symbols.

<https://www.binance.com/restapipub.html#symbols-price-ticker>

Returns List of market tickers

```
[
  {
    "symbol": "LTCBTC",
    "price": "4.00000200"
  },
  {
    "symbol": "ETHBTC",
    "price": "0.07946600"
  }
]
```

Raises `BinanceRequestException`, `BinanceAPIException`

get_asset_balance (*asset*, ***params*)

Get current asset balance.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#account-information-user_data

Parameters

- **asset** (*str*) – required
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns dictionary or None if not found

```
{
  "asset": "BTC",
  "free": "4723846.89208129",
  "locked": "0.00000000"
}
```

Raises `BinanceRequestException`, `BinanceAPIException`

get_asset_details (***params*)

Fetch details on assets.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/wapi-api.md#asset-detail-user_data

Parameters **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

```
{
  "success": true,
  "assetDetail": {
    "CTR": {
      "minWithdrawAmount": "70.00000000", //min withdraw amount
      "depositStatus": false, //deposit status
      "withdrawFee": 35, // withdraw fee
      "withdrawStatus": true, //withdraw status
      "depositTip": "Delisted, Deposit Suspended" //reason
    },
    "SKY": {
      "minWithdrawAmount": "0.02000000",
      "depositStatus": true,

```

(continues on next page)

(continued from previous page)

```

        "withdrawFee": 0.01,
        "withdrawStatus": true
    }
}

```

Raises `BinanceWithdrawException`

get_deposit_address (**params)

Fetch a deposit address for a symbol

<https://www.binance.com/restapipub.html>

Parameters

- **asset** (*str*) – required
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

```

{
  "address": "0x6915f16f8791d0a1cc2bf47c13a6b2a92000504b",
  "success": true,
  "addressTag": "1231212",
  "asset": "BNB"
}

```

Raises `BinanceRequestException`, `BinanceAPIException`

get_deposit_history (**params)

Fetch deposit history.

<https://www.binance.com/restapipub.html>

Parameters

- **asset** (*str*) – optional
- **startTime** (*long*) – optional
- **endTime** (*long*) – optional
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

```

{
  "depositList": [
    {
      "insertTime": 1508198532000,
      "amount": 0.04670582,
      "asset": "ETH",
      "status": 1
    }
  ],
  "success": true
}

```

Raises `BinanceRequestException`, `BinanceAPIException`

`get_dust_log(**params)`

Get log of small amounts exchanged for BNB.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/wapi-api.md#dustlog-user_data

Parameters `recvWindow` (`int`) – the number of milliseconds the request is valid for

Returns API response

```
{
  "success": true,
  "results": {
    "total": 2,    //Total counts of exchange
    "rows": [
      {
        "transferred_total": "0.00132256", # Total transfered BNB_

            "minNotional": "0.00100000"
        }
    ]
}

```

Raises `BinanceRequestException`, `BinanceAPIException`

get_historical_klines (*symbol, interval, start_str, end_str=None*)

Get Historical Klines from Binance

See dateparser docs for valid start and end string formats <http://dateparser.readthedocs.io/en/latest/>

If using offset strings for dates add “UTC” to date string e.g. “now UTC”, “11 hours ago UTC”

Parameters

- **symbol** (*str*) – Name of symbol pair e.g BNBBTC
- **interval** (*str*) – Binance Kline interval
- **start_str** (*str/int*) – Start date string in UTC format or timestamp in milliseconds
- **end_str** (*str/int*) – optional - end date string in UTC format or timestamp in milliseconds (default will fetch everything up to now)

Returns list of OHLCV values

get_historical_klines_generator (*symbol, interval, start_str, end_str=None*)

Get Historical Klines from Binance

See dateparser docs for valid start and end string formats <http://dateparser.readthedocs.io/en/latest/>

If using offset strings for dates add “UTC” to date string e.g. “now UTC”, “11 hours ago UTC”

Parameters

- **symbol** (*str*) – Name of symbol pair e.g BNBBTC
- **interval** (*str*) – Binance Kline interval
- **start_str** (*str/int*) – Start date string in UTC format or timestamp in milliseconds
- **end_str** (*str/int*) – optional - end date string in UTC format or timestamp in milliseconds (default will fetch everything up to now)

Returns generator of OHLCV values

get_historical_trades (**params)

Get older trades.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#recent-trades-list>

Parameters

- **symbol** (*str*) – required
- **limit** (*int*) – Default 500; max 500.
- **fromId** (*str*) – TradeId to fetch from. Default gets most recent trades.

Returns API response

```
[
  {
    "id": 28457,
    "price": "4.00000100",
    "qty": "12.00000000",
    "time": 1499865549590,
    "isBuyerMaker": true,
    "isBestMatch": true
  }
]
```

Raises BinanceRequestException, BinanceAPIException

get_klines (**params)

Kline/candlestick bars for a symbol. Klines are uniquely identified by their open time.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#klinecandlestick-data>

Parameters

- **symbol** (*str*) – required
- **interval** (*str*) –
–
- **limit** (*int*) –
– Default 500; max 500.
- **startTime** (*int*) –
- **endTime** (*int*) –

Returns API response

```
[
  [
    1499040000000,      # Open time
    "0.01634790",      # Open
    "0.80000000",      # High
    "0.01575800",      # Low
    "0.01577100",      # Close
    "148976.11427815", # Volume
    1499644799999,     # Close time
    "2434.19055334",   # Quote asset volume
  ]
]
```

(continues on next page)

(continued from previous page)

```

    308,                # Number of trades
    "1756.87402397",   # Taker buy base asset volume
    "28.46694368",    # Taker buy quote asset volume
    "17928899.62484339" # Can be ignored
]
]

```

Raises `BinanceRequestException`, `BinanceAPIException`

get_my_trades (**params)

Get trades for a specific symbol.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#account-trade-list-user_data

Parameters

- **symbol** (*str*) – required
- **limit** (*int*) – Default 500; max 500.
- **fromId** (*int*) – TradeId to fetch from. Default gets most recent trades.
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

```

[
  {
    "id": 28457,
    "price": "4.00000100",
    "qty": "12.00000000",
    "commission": "10.10000000",
    "commissionAsset": "BNB",
    "time": 1499865549590,
    "isBuyer": true,
    "isMaker": false,
    "isBestMatch": true
  }
]

```

Raises `BinanceRequestException`, `BinanceAPIException`

get_open_orders (**params)

Get all open orders on a symbol.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#current-open-orders-user_data

Parameters

- **symbol** (*str*) – optional
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

```
[
  {
    "symbol": "LTCBTC",
    "orderId": 1,
    "clientOrderId": "myOrder1",
    "price": "0.1",
    "origQty": "1.0",
    "executedQty": "0.0",
    "status": "NEW",
    "timeInForce": "GTC",
    "type": "LIMIT",
    "side": "BUY",
    "stopPrice": "0.0",
    "icebergQty": "0.0",
    "time": 1499827319559
  }
]
```

Raises BinanceRequestException, BinanceAPIException

get_order (**params)

Check an order's status. Either orderId or origClientId must be sent.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#query-order-user_data

Parameters

- **symbol** (*str*) – required
- **orderId** (*int*) – The unique order id
- **origClientId** (*str*) – optional
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

```
{
  "symbol": "LTCBTC",
  "orderId": 1,
  "clientOrderId": "myOrder1",
  "price": "0.1",
  "origQty": "1.0",
  "executedQty": "0.0",
  "status": "NEW",
  "timeInForce": "GTC",
  "type": "LIMIT",
  "side": "BUY",
  "stopPrice": "0.0",
  "icebergQty": "0.0",
  "time": 1499827319559
}
```

Raises BinanceRequestException, BinanceAPIException

get_order_book (**params)

Get the Order Book for the market

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#order-book>

Parameters

- **symbol** (*str*) – required
- **limit** (*int*) – Default 100; max 1000

Returns API response

```
{
  "lastUpdateId": 1027024,
  "bids": [
    [
      "4.00000000",      # PRICE
      "431.00000000",   # QTY
      []                # Can be ignored
    ]
  ],
  "asks": [
    [
      "4.00000200",
      "12.00000000",
      []
    ]
  ]
}
```

Raises `BinanceRequestException`, `BinanceAPIException`

get_orderbook_ticker (***params*)

Latest price for a symbol or symbols.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#symbol-order-book-ticker>

Parameters **symbol** (*str*) –

Returns API response

```
{
  "symbol": "LTCBTC",
  "bidPrice": "4.00000000",
  "bidQty": "431.00000000",
  "askPrice": "4.00000200",
  "askQty": "9.00000000"
}
```

OR

```
[
  {
    "symbol": "LTCBTC",
    "bidPrice": "4.00000000",
    "bidQty": "431.00000000",
    "askPrice": "4.00000200",
    "askQty": "9.00000000"
  },
  {
    "symbol": "ETHBTC",
```

(continues on next page)

(continued from previous page)

```

        "bidPrice": "0.07946700",
        "bidQty": "9.00000000",
        "askPrice": "100000.00000000",
        "askQty": "1000.00000000"
    }
]

```

Raises BinanceRequestException, BinanceAPIException

get_orderbook_tickers()

Best price/qty on the order book for all symbols.

<https://www.binance.com/restapipub.html#symbols-order-book-ticker>

Returns List of order book market entries

```

[
  {
    "symbol": "LTCBTC",
    "bidPrice": "4.00000000",
    "bidQty": "431.00000000",
    "askPrice": "4.00000200",
    "askQty": "9.00000000"
  },
  {
    "symbol": "ETHBTC",
    "bidPrice": "0.07946700",
    "bidQty": "9.00000000",
    "askPrice": "100000.00000000",
    "askQty": "1000.00000000"
  }
]

```

Raises BinanceRequestException, BinanceAPIException

get_products()

Return list of products currently listed on Binance

Use `get_exchange_info()` call instead

Returns list - List of product dictionaries

Raises BinanceRequestException, BinanceAPIException

get_recent_trades(params)**

Get recent trades (up to last 500).

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#recent-trades-list>

Parameters

- **symbol** (*str*) – required
- **limit** (*int*) – Default 500; max 500.

Returns API response

```
[
  {
    "id": 28457,
    "price": "4.00000100",
    "qty": "12.00000000",
    "time": 1499865549590,
    "isBuyerMaker": true,
    "isBestMatch": true
  }
]
```

Raises `BinanceRequestException`, `BinanceAPIException`

`get_server_time()`

Test connectivity to the Rest API and get the current server time.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#check-server-time>

Returns Current server time

```
{
  "serverTime": 1499827319559
}
```

Raises `BinanceRequestException`, `BinanceAPIException`

`get_symbol_info(symbol)`

Return information about a symbol

Parameters `symbol` (*str*) – required e.g BNBBTC

Returns Dict if found, None if not

```
{
  "symbol": "ETHBTC",
  "status": "TRADING",
  "baseAsset": "ETH",
  "baseAssetPrecision": 8,
  "quoteAsset": "BTC",
  "quotePrecision": 8,
  "orderTypes": ["LIMIT", "MARKET"],
  "icebergAllowed": false,
  "filters": [
    {
      "filterType": "PRICE_FILTER",
      "minPrice": "0.00000100",
      "maxPrice": "100000.00000000",
      "tickSize": "0.00000100"
    }, {
      "filterType": "LOT_SIZE",
      "minQty": "0.00100000",
      "maxQty": "100000.00000000",
      "stepSize": "0.00100000"
    }, {
      "filterType": "MIN_NOTIONAL",
      "minNotional": "0.00100000"
    }
  ]
}
```

(continues on next page)

(continued from previous page)

```

    }
  ]
}

```

Raises BinanceRequestException, BinanceAPIException

get_symbol_ticker (**params)

Latest price for a symbol or symbols.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#24hr-ticker-price-change-statistics>

Parameters **symbol** (*str*) –

Returns API response

```

{
  "symbol": "LTCBTC",
  "price": "4.00000200"
}

```

OR

```

[
  {
    "symbol": "LTCBTC",
    "price": "4.00000200"
  },
  {
    "symbol": "ETHBTC",
    "price": "0.07946600"
  }
]

```

Raises BinanceRequestException, BinanceAPIException

get_system_status ()

Get system status detail.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/wapi-api.md#system-status-system>

Returns API response

```

{
  "status": 0,           # 0: normal system maintenance
  "msg": "normal"      # normal or System maintenance.
}

```

Raises BinanceAPIException

get_ticker (**params)

24 hour price change statistics.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#24hr-ticker-price-change-statistics>

Parameters `symbol` (*str*) –

Returns API response

```
{
  "priceChange": "-94.99999800",
  "priceChangePercent": "-95.960",
  "weightedAvgPrice": "0.29628482",
  "prevClosePrice": "0.10002000",
  "lastPrice": "4.00000200",
  "bidPrice": "4.00000000",
  "askPrice": "4.00000200",
  "openPrice": "99.00000000",
  "highPrice": "100.00000000",
  "lowPrice": "0.10000000",
  "volume": "8913.30000000",
  "openTime": 1499783499040,
  "closeTime": 1499869899040,
  "fristId": 28385,    # First tradeId
  "lastId": 28460,   # Last tradeId
  "count": 76        # Trade count
}
```

OR

```
[
  {
    "priceChange": "-94.99999800",
    "priceChangePercent": "-95.960",
    "weightedAvgPrice": "0.29628482",
    "prevClosePrice": "0.10002000",
    "lastPrice": "4.00000200",
    "bidPrice": "4.00000000",
    "askPrice": "4.00000200",
    "openPrice": "99.00000000",
    "highPrice": "100.00000000",
    "lowPrice": "0.10000000",
    "volume": "8913.30000000",
    "openTime": 1499783499040,
    "closeTime": 1499869899040,
    "fristId": 28385,    # First tradeId
    "lastId": 28460,   # Last tradeId
    "count": 76        # Trade count
  }
]
```

Raises `BinanceRequestException`, `BinanceAPIException`

get_trade_fee (***params*)

Get trade fee.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/wapi-api.md#trade-fee-user_data

Parameters

- **symbol** (*str*) – optional
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

```
{
  "tradeFee": [
    {
      "symbol": "ADABNB",
      "maker": 0.9000,
      "taker": 1.0000
    }, {
      "symbol": "ENBBTC",
      "maker": 0.3000,
      "taker": 0.3000
    }
  ],
  "success": true
}
```

Raises BinanceWithdrawException

get_withdraw_fee (**params)

Fetch the withdrawal fee for an asset

Parameters

- **asset** (*str*) – required
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

```
{
  "withdrawFee": "0.0005",
  "success": true
}
```

Raises BinanceRequestException, BinanceAPIException

get_withdraw_history (**params)

Fetch withdraw history.

<https://www.binance.com/restapipub.html>

Parameters

- **asset** (*str*) – optional
- **startTime** (*long*) – optional
- **endTime** (*long*) – optional
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

```
{
  "withdrawList": [
    {
      "amount": 1,
      "address": "0x6915f16f8791d0a1cc2bf47c13a6b2a92000504b",
      "asset": "ETH",

```

(continues on next page)

(continued from previous page)

```

        "applyTime": 1508198532000
        "status": 4
    },
    {
        "amount": 0.005,
        "address": "0x6915f16f8791d0a1cc2bf47c13a6b2a92000504b",
        "txId":
↪ "0x80aaabed54bdab3f6de5868f89929a2371ad21d666f20f7393d1a3389fad95a1",
        "asset": "ETH",
        "applyTime": 1508198532000,
        "status": 4
    }
],
"success": true
}

```

Raises `BinanceRequestException`, `BinanceAPIException`

order_limit (*timeInForce*='GTC', ***params*)

Send in a new limit order

Any order with an `icebergQty` MUST have `timeInForce` set to GTC.

Parameters

- **symbol** (*str*) – required
- **side** (*str*) – required
- **quantity** (*decimal*) – required
- **price** (*str*) – required
- **timeInForce** (*str*) – default Good till cancelled
- **newClientId** (*str*) – A unique id for the order. Automatically generated if not sent.
- **icebergQty** (*decimal*) – Used with `LIMIT`, `STOP_LOSS_LIMIT`, and `TAKE_PROFIT_LIMIT` to create an iceberg order.
- **newOrderRespType** (*str*) – Set the response JSON. `ACK`, `RESULT`, or `FULL`; default: `RESULT`.
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises `BinanceRequestException`, `BinanceAPIException`, `BinanceOrderException`, `BinanceOrderMinAmountException`, `BinanceOrderMinPriceException`, `BinanceOrderMinTotalException`, `BinanceOrderUnknownSymbolException`, `BinanceOrderInactiveSymbolException`

order_limit_buy (*timeInForce*='GTC', ***params*)

Send in a new limit buy order

Any order with an `icebergQty` MUST have `timeInForce` set to GTC.

Parameters

- **symbol** (*str*) – required

- **quantity** (*decimal*) – required
- **price** (*str*) – required
- **timeInForce** (*str*) – default Good till cancelled
- **newClientId** (*str*) – A unique id for the order. Automatically generated if not sent.
- **stopPrice** (*decimal*) – Used with stop orders
- **icebergQty** (*decimal*) – Used with iceberg orders
- **newOrderRespType** (*str*) – Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises `BinanceRequestException`, `BinanceAPIException`, `BinanceOrderException`, `BinanceOrderMinAmountException`, `BinanceOrderMinPriceException`, `BinanceOrderMinTotalException`, `BinanceOrderUnknownSymbolException`, `BinanceOrderInactiveSymbolException`

order_limit_sell (*timeInForce='GTC', **params*)

Send in a new limit sell order

Parameters

- **symbol** (*str*) – required
- **quantity** (*decimal*) – required
- **price** (*str*) – required
- **timeInForce** (*str*) – default Good till cancelled
- **newClientId** (*str*) – A unique id for the order. Automatically generated if not sent.
- **stopPrice** (*decimal*) – Used with stop orders
- **icebergQty** (*decimal*) – Used with iceberg orders
- **newOrderRespType** (*str*) – Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises `BinanceRequestException`, `BinanceAPIException`, `BinanceOrderException`, `BinanceOrderMinAmountException`, `BinanceOrderMinPriceException`, `BinanceOrderMinTotalException`, `BinanceOrderUnknownSymbolException`, `BinanceOrderInactiveSymbolException`

order_market (***params*)

Send in a new market order

Parameters

- **symbol** (*str*) – required
- **side** (*str*) – required

- **quantity** (*decimal*) – required
- **newClientId** (*str*) – A unique id for the order. Automatically generated if not sent.
- **newOrderRespType** (*str*) – Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

order_market_buy (***params*)

Send in a new market buy order

Parameters

- **symbol** (*str*) – required
- **quantity** (*decimal*) – required
- **newClientId** (*str*) – A unique id for the order. Automatically generated if not sent.
- **newOrderRespType** (*str*) – Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

order_market_sell (***params*)

Send in a new market sell order

Parameters

- **symbol** (*str*) – required
- **quantity** (*decimal*) – required
- **newClientId** (*str*) – A unique id for the order. Automatically generated if not sent.
- **newOrderRespType** (*str*) – Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

ping()

Test connectivity to the Rest API.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#test-connectivity>

Returns Empty array

```
{ }
```

Raises BinanceRequestException, BinanceAPIException

stream_close (*listenKey*)

Close out a user data stream.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#close-user-data-stream-user_stream

Parameters **listenKey** (*str*) – required

Returns API response

```
{ }
```

Raises BinanceRequestException, BinanceAPIException

stream_get_listen_key ()

Start a new user data stream and return the listen key If a stream already exists it should return the same key. If the stream becomes invalid a new key is returned.

Can be used to keep the user stream alive.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#start-user-data-stream-user_stream

Returns API response

```
{
  "listenKey":
  → "pqia91ma19a5s61cv6a81va65sdf19v8a65a1a5s61cv6a81va65sdf19v8a65a1"
}
```

Raises BinanceRequestException, BinanceAPIException

stream_keepalive (*listenKey*)

PING a user data stream to prevent a time out.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/rest-api.md#keepalive-user-data-stream-user_stream

Parameters **listenKey** (*str*) – required

Returns API response

```
{ }
```

Raises BinanceRequestException, BinanceAPIException

withdraw (**params)

Submit a withdraw request.

<https://www.binance.com/restapipub.html>

Assumptions:

- You must have Withdraw permissions enabled on your API key
- You must have withdrawn to the address specified through the website and approved the transaction via email

Parameters

- **asset** (*str*) – required
- **amount** (*decimal*) – required
- **name** (*str*) – optional - Description of the address, default asset value passed will be used
- **recvWindow** (*int*) – the number of milliseconds the request is valid for

Returns API response

```
{
  "msg": "success",
  "success": true,
  "id": "7213fea8e94b4a5593d507237e5a555b"
}
```

Raises BinanceRequestException, BinanceAPIException, BinanceWithdrawException

depthcache module

class binance.depthcache.DepthCache (*symbol*)

Bases: object

__init__ (*symbol*)

Intialise the DepthCache

Parameters **symbol** (*string*) – Symbol to create depth cache for

add_ask (*ask*)

Add an ask to the cache

Parameters **ask** –

Returns

add_bid (*bid*)

Add a bid to the cache

Parameters **bid** –

Returns

get_asks ()

Get the current asks

Returns list of asks with price and quantity as floats

```
[
  [
    0.0001955, # Price
    57.0'      # Quantity
  ],
  [
    0.00019699,
    778.0
  ],
  [
    0.000197,
    64.0
  ],
  [
    0.00019709,
    1130.0
  ],
  [
    0.0001971,
    385.0
  ]
]
```

get_bids()

Get the current bids

Returns list of bids with price and quantity as floats

```
[
  [
    0.0001946, # Price
    45.0       # Quantity
  ],
  [
    0.00019459,
    2384.0
  ],
  [
    0.00019158,
    5219.0
  ],
  [
    0.00019157,
    1180.0
  ],
  [
    0.00019082,
    287.0
  ]
]
```

static sort_depth (*vals*, *reverse=False*)

Sort bids or asks by price

class `binance.depthcache.DepthCacheManager` (*client*, *symbol*, *callback=None*, *refresh_interval=1800*, *bm=None*)

Bases: `object`

__init__ (*client*, *symbol*, *callback=None*, *refresh_interval=1800*, *bm=None*)

Initialise the DepthCacheManager

Parameters

- **client** (*binance.Client*) – Binance API client
- **symbol** (*string*) – Symbol to create depth cache for
- **callback** (*function*) – Optional function to receive depth cache updates
- **refresh_interval** (*int*) – Optional number of seconds between cache refresh, use 0 or None to disable

close (*close_socket=False*)

Close the open socket for this manager

Returns

get_depth_cache ()

Get the current depth cache

Returns DepthCache object

exceptions module

exception `binance.exceptions.BinanceAPIException` (*response*)

Bases: `exceptions.Exception`

__init__ (*response*)

`x.__init__(...)` initializes `x`; see `help(type(x))` for signature

exception `binance.exceptions.BinanceOrderException` (*code, message*)

Bases: `exceptions.Exception`

__init__ (*code, message*)

`x.__init__(...)` initializes `x`; see `help(type(x))` for signature

exception `binance.exceptions.BinanceOrderInactiveSymbolException` (*value*)

Bases: `binance.exceptions.BinanceOrderException`

__init__ (*value*)

`x.__init__(...)` initializes `x`; see `help(type(x))` for signature

exception `binance.exceptions.BinanceOrderMinAmountException` (*value*)

Bases: `binance.exceptions.BinanceOrderException`

__init__ (*value*)

`x.__init__(...)` initializes `x`; see `help(type(x))` for signature

exception `binance.exceptions.BinanceOrderMinPriceException` (*value*)

Bases: `binance.exceptions.BinanceOrderException`

__init__ (*value*)

`x.__init__(...)` initializes `x`; see `help(type(x))` for signature

exception `binance.exceptions.BinanceOrderMinTotalException` (*value*)

Bases: `binance.exceptions.BinanceOrderException`

__init__ (*value*)

`x.__init__(...)` initializes `x`; see `help(type(x))` for signature

exception `binance.exceptions.BinanceOrderUnknownSymbolException` (*value*)

Bases: `binance.exceptions.BinanceOrderException`

`__init__(value)`
`x.__init__(...)` initializes x; see `help(type(x))` for signature

exception `binance.exceptions.BinanceRequestException(message)`
 Bases: `exceptions.Exception`

`__init__(message)`
`x.__init__(...)` initializes x; see `help(type(x))` for signature

exception `binance.exceptions.BinanceWithdrawException(message)`
 Bases: `exceptions.Exception`

`__init__(message)`
`x.__init__(...)` initializes x; see `help(type(x))` for signature

helpers module

`binance.helpers.date_to_milliseconds(date_str)`
 Convert UTC date to milliseconds

If using offset strings add “UTC” to date string e.g. “now UTC”, “11 hours ago UTC”

See dateparse docs for formats <http://dateparser.readthedocs.io/en/latest/>

Parameters `date_str(str)` – date in readable format, i.e. “January 01, 2018”, “11 hours ago UTC”, “now UTC”

`binance.helpers.interval_to_milliseconds(interval)`
 Convert a Binance interval string to milliseconds

Parameters `interval(str)` – Binance interval string, e.g.: 1m, 3m, 5m, 15m, 30m, 1h, 2h, 4h, 6h, 8h, 12h, 1d, 3d, 1w

Returns int value of interval in milliseconds None if interval prefix is not a decimal integer None if interval suffix is not one of m, h, d, w

websockets module

class `binance.websockets.BinanceClientFactory(*args, **kwargs)`
 Bases: `autobahn.twisted.websocket.WebSocketClientFactory`, `binance.websockets.BinanceReconnectingClientFactory`

clientConnectionFailed (`connector, reason`)
 Called when a connection has failed to connect.

It may be useful to call `connector.connect()` - this will reconnect.

@type reason: `L{twisted.python.failure.Failure}`

clientConnectionLost (`connector, reason`)
 Called when an established connection is lost.

It may be useful to call `connector.connect()` - this will reconnect.

@type reason: `L{twisted.python.failure.Failure}`

protocol
 alias of `BinanceClientProtocol`

class `binance.websockets.BinanceClientProtocol`
 Bases: `autobahn.twisted.websocket.WebSocketClientProtocol`

`__init__()`
x.`__init__()` initializes x; see `help(type(x))` for signature

onConnect (*response*)

Callback fired directly after WebSocket opening handshake when new WebSocket server connection was established.

Parameters **response** (instance of `autobahn.websocket.protocol.ConnectionResponse`) – WebSocket connection response information.

onMessage (*payload, isBinary*)

Implements `autobahn.websocket.interfaces.IWebSocketChannel.onMessage()`

class `binance.websockets.BinanceReconnectingClientFactory`

Bases: `twisted.internet.protocol.ReconnectingClientFactory`

initialDelay = 0.1

maxDelay = 10

maxRetries = 5

class `binance.websockets.BinanceSocketManager` (*client, user_timeout=1800*)

Bases: `threading.Thread`

DEFAULT_USER_TIMEOUT = 1800

STREAM_URL = 'wss://stream.binance.com:9443/'

WEBSOCKET_DEPTH_10 = '10'

WEBSOCKET_DEPTH_20 = '20'

WEBSOCKET_DEPTH_5 = '5'

`__init__` (*client, user_timeout=1800*)

Initialise the `BinanceSocketManager`

Parameters

- **client** (*binance.Client*) – Binance API client
- **user_timeout** (*int*) – Custom websocket timeout

close ()

Close all connections

run ()

Method representing the thread's activity.

You may override this method in a subclass. The standard `run()` method invokes the callable object passed to the object's constructor as the target argument, if any, with sequential and keyword arguments taken from the `args` and `kwargs` arguments, respectively.

start_aggtrade_socket (*symbol, callback*)

Start a websocket for symbol trade data

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md#aggregate-trade-streams>

Parameters

- **symbol** (*str*) – required
- **callback** (*function*) – callback function to handle messages

Returns connection key string if successful, False otherwise

Message Format

```
{
  "e": "aggTrade",           # event type
  "E": 1499405254326,       # event time
  "s": "ETHBTC",           # symbol
  "a": 70232,               # aggregated tradeid
  "p": "0.10281118",       # price
  "q": "8.15632997",       # quantity
  "f": 77489,              # first breakdown trade id
  "l": 77489,              # last breakdown trade id
  "T": 1499405254324,     # trade time
  "m": false,              # whether buyer is a maker
  "M": true                 # can be ignored
}
```

start_depth_socket (*symbol, callback, depth=None*)

Start a websocket for symbol market depth returning either a diff or a partial book

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md#partial-book-depth-streams>

Parameters

- **symbol** (*str*) – required
- **callback** (*function*) – callback function to handle messages
- **depth** (*str*) – optional Number of depth entries to return, default None. If passed returns a partial book instead of a diff

Returns connection key string if successful, False otherwise

Partial Message Format

```
{
  "lastUpdateId": 160,     # Last update ID
  "bids": [                # Bids to be updated
    [
      "0.0024",           # price level to be updated
      "10",               # quantity
      []                  # ignore
    ]
  ],
  "asks": [                # Asks to be updated
    [
      "0.0026",           # price level to be updated
      "100",              # quantity
      []                  # ignore
    ]
  ]
}
```

Diff Message Format

```
{
  "e": "depthUpdate",     # Event type
  "E": 123456789,         # Event time
  "s": "BNBBTC",         # Symbol
  "U": 157,               # First update ID in event
}
```

(continues on next page)

(continued from previous page)

```

    "u": 160,          # Final update ID in event
    "b": [            # Bids to be updated
        [
            "0.0024", # price level to be updated
            "10",     # quantity
            []        # ignore
        ]
    ],
    "a": [            # Asks to be updated
        [
            "0.0026", # price level to be updated
            "100",    # quantity
            []        # ignore
        ]
    ]
}

```

start_kline_socket (*symbol, callback, interval='1m'*)

Start a websocket for symbol kline data

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md#klinecandlestick-streams>

Parameters

- **symbol** (*str*) – required
- **callback** (*function*) – callback function to handle messages
- **interval** (*str*) – Kline interval, default KLINE_INTERVAL_1MINUTE

Returns connection key string if successful, False otherwise

Message Format

```

{
    "e": "kline",          # event type
    "E": 1499404907056,   # event time
    "s": "ETHBTC",        # symbol
    "k": {
        "t": 1499404860000, # start time of this bar
        "T": 1499404919999, # end time of this bar
        "s": "ETHBTC",     # symbol
        "i": "1m",         # interval
        "f": 77462,        # first trade id
        "L": 77465,        # last trade id
        "o": "0.10278577",  # open
        "c": "0.10278645",  # close
        "h": "0.10278712",  # high
        "l": "0.10278518",  # low
        "v": "17.47929838", # volume
        "n": 4,             # number of trades
        "x": false,        # whether this bar is_
    }
    ↪ final
    "q": "1.79662878",     # quote volume
    "V": "2.34879839",     # volume of active buy
    "Q": "0.24142166",     # quote volume of active buy
    "B": "13279784.01349473" # can be ignored
}

```

(continues on next page)

(continued from previous page)

```

    }
}

```

start_miniticker_socket (*callback*, *update_time=1000*)

Start a miniticker websocket for all trades

This is not in the official Binance api docs, but this is what feeds the right column on a ticker page on Binance.

Parameters

- **callback** (*function*) – callback function to handle messages
- **update_time** (*int*) – time between callbacks in milliseconds, must be 1000 or greater

Returns connection key string if successful, False otherwise

Message Format

```

[
  {
    'e': '24hrMiniTicker', # Event type
    'E': 1515906156273,    # Event time
    's': 'QTUMETH',       # Symbol
    'c': '0.03836900',    # close
    'o': '0.03953500',    # open
    'h': '0.04400000',    # high
    'l': '0.03756000',    # low
    'v': '147435.80000000', # volume
    'q': '5903.84338533'  # quote volume
  }
]

```

start_multiplex_socket (*streams*, *callback*)

Start a multiplexed socket using a list of socket names. User stream sockets can not be included.

Symbols in socket name must be lowercase i.e `bnbtc@aggTrade`, `neobtc@ticker`

Combined stream events are wrapped as follows: {"stream": "<streamName>","data":<rawPayload>}

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md>

Parameters

- **streams** (*list*) – list of stream names in lower case
- **callback** (*function*) – callback function to handle messages

Returns connection key string if successful, False otherwise

Message Format - see Binance API docs for all types

start_symbol_ticker_socket (*symbol*, *callback*)

Start a websocket for a symbol's ticker data

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md#individual-symbol-ticker-streams>

Parameters

- **symbol** (*str*) – required
- **callback** (*function*) – callback function to handle messages

Returns connection key string if successful, False otherwise

Message Format

```
{
  "e": "24hrTicker", # Event type
  "E": 123456789, # Event time
  "s": "BNBBTC", # Symbol
  "p": "0.0015", # Price change
  "P": "250.00", # Price change percent
  "w": "0.0018", # Weighted average price
  "x": "0.0009", # Previous day's close price
  "c": "0.0025", # Current day's close price
  "Q": "10", # Close trade's quantity
  "b": "0.0024", # Best bid price
  "B": "10", # Bid bid quantity
  "a": "0.0026", # Best ask price
  "A": "100", # Best ask quantity
  "o": "0.0010", # Open price
  "h": "0.0025", # High price
  "l": "0.0010", # Low price
  "v": "10000", # Total traded base asset volume
  "q": "18", # Total traded quote asset volume
  "O": 0, # Statistics open time
  "C": 86400000, # Statistics close time
  "F": 0, # First trade ID
  "L": 18150, # Last trade Id
  "n": 18151 # Total number of trades
}
```

start_ticker_socket (*callback*)

Start a websocket for all ticker data

By default all markets are included in an array.

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md#all-market-tickers-stream>

Parameters **callback** (*function*) – callback function to handle messages

Returns connection key string if successful, False otherwise

Message Format

```
[
  {
    'F': 278610,
    'o': '0.07393000',
    's': 'BCCBTC',
    'C': 1509622420916,
    'b': '0.07800800',
    'l': '0.07160300',
    'h': '0.08199900',
    'L': 287722,
    'P': '6.694',
    'Q': '0.10000000',

start_trade_socket (*symbol*, *callback*)

Start a websocket for symbol trade data

<https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md#trade-streams>

Parameters

- **symbol** (*str*) – required
- **callback** (*function*) – callback function to handle messages

Returns connection key string if successful, False otherwise

Message Format

```

{
    "e": "trade",      # Event type
    "E": 123456789,   # Event time
    "s": "BNBBTC",    # Symbol
    "t": 12345,       # Trade ID
    "p": "0.001",     # Price
    "q": "100",       # Quantity
    "b": 88,          # Buyer order Id
    "a": 50,          # Seller order Id
    "T": 123456785,   # Trade time
    "m": true,        # Is the buyer the market maker?
    "M": true         # Ignore.
}

```

start_user_socket (*callback*)

Start a websocket for user data

<https://www.binance.com/restapipub.html#user-wss-endpoint>

Parameters **callback** (*function*) – callback function to handle messages**Returns** connection key string if successful, False otherwise

Message Format - see Binance API docs for all types

stop_socket (*conn_key*)

Stop a websocket given the connection key

Parameters **conn_key** (*string*) – Socket connection key**Returns** connection key string if successful, False otherwise
