The tracemalloc module is a debug tool to trace memory blocks allocated by Python. It provides the following information:

- Traceback where an object was allocated
- Statistics on allocated memory blocks per filename and per line number: total size, number and average size of allocated memory blocks
- Compute the differences between two snapshots to detect memory leaks

To trace most memory blocks allocated by Python, the module should be started as early as possible by setting the `PYTHONTRACEMALLOC` environment variable to 1. The `tracemalloc.start()` function can be called at runtime to start tracing Python memory allocations.

By default, a trace of an allocated memory block only stores the most recent frame (1 frame). To store 25 frames at startup: set the `PYTHONTRACEMALLOC` environment variable to 25.

Websites:

- [Project homepage \(this documentation\)](#)
- [Entry in the Python Cheeseshop \(PyPI\)](#)
- [Source code at Github](#)
- [Statistics on the project at Ohloh](#)
- [Qt graphical interface: tracemallocqt](#)

The tracemalloc module has been integrated in Python 3.4: read [tracemalloc module documentation](#).

Installation

Use Python 3.4 or newer

tracemalloc is now part of Python 3.4 standard library! Nothing to do, enjoy!

Note: Installing pytracemalloc on Python older than 3.4 is much more complex, it requires to recompile a patched version of Python. It is worth to try to run your application on Python 3.4 rather than trying to compile and install manually pytracemalloc on older versions of Python.

Linux packages

Ubuntu packages for pytracemalloc 1.2: [pytracemalloc 1.0 PPA](#) by Ionel Cristian Maries.

Manual installation

First, create the directory `/opt/tracemalloc`. Example:

```
sudo mkdir /opt/tracemalloc
sudo chown $USER: /opt/tracemalloc
```

Go into the `/opt/tracemalloc` directory. Then follow these commands to compile a patched Python and install pytracemalloc:

```
wget http://www.python.org/ftp/python/2.7.8/Python-2.7.8.tgz
wget https://pypi.python.org/packages/source/p/pytracemalloc/pytracemalloc-1.2.tar.gz
tar -xf Python-2.7.8.tgz
tar -xf pytracemalloc-1.2.tar.gz
```

```
cd Python-2.7.8
patch -p1 < ../pytracemalloc-1.2/patches/2.7/pep445.patch
./configure --enable-unicode=ucs4 --prefix=/opt/tracemalloc/py27
make install
cd ../pytracemalloc-1.2
/opt/tracemalloc/py27/bin/python2.7 setup.py install
```

You have now a patched Python 2.7 installed in `/opt/tracemalloc/py27/bin/python2.7` with the `tracemalloc` module installed, congrats!

To use modules installed for the system Python, directories of `sys.path` should be copied from the system Python to the patched Python. Example of command to generate an environment variable to use system modules:

```
python -c 'import sys; print("PYTHONPATH=%s" % ":".join(filter(bool, sys.path)))'
```

Patch Python

To install `pytracemalloc`, you need a modified Python runtime:

- Download Python source code (tarball)
- Uncompress the tarball and enter the newly created directory (ex: `Python-2.7.8`)
- Apply the patch of your Python version, example:

```
patch -p1 < ~/pytracemalloc-1.0/patches/2.7/pep445.patch
```

- Compile and install Python:

```
./configure --enable-unicode=ucs4 --prefix=/opt/python && make && sudo make ↵
↵install
```

Note: `--enable-unicode=ucs4` uses the wide mode: store Unicode code points in 32-bit (4 bytes per character). It is the mode used by all Linux distributions. Your modified Python will have the same ABI and so you should be able to use extension modules of the system.

`--enable-unicode=ucs4` is no more needed with Python 3.3 which always uses compact strings: see the PEP 393.

Note: Currently, only patches for Python 2.7 and 3.3 are provided. If you need patches for other Python versions, please ask. The code should work on Python 2.5-3.3.

Compile and install pytracemalloc

Dependencies:

- Python 2.5 - 3.3

Download `pytracemalloc` from the Python Cheeseshop (PyPI).

Install `pytracemalloc`:

```
/opt/python/bin/python setup.py install
```

Examples

Display the top 10

Display the 10 files allocating the most memory:

```
import tracemalloc

tracemalloc.start()

# ... run your application ...

snapshot = tracemalloc.take_snapshot()
top_stats = snapshot.statistics('lineno')

print("[ Top 10 ]")
for stat in top_stats[:10]:
    print(stat)
```

Example of output of the Python test suite:

```
[ Top 10 ]
<frozen importlib._bootstrap>:716: size=4855 KiB, count=39328, average=126 B
<frozen importlib._bootstrap>:284: size=521 KiB, count=3199, average=167 B
/usr/lib/python3.4/collections/__init__.py:368: size=244 KiB, count=2315, average=108.
↳B
/usr/lib/python3.4/unittest/case.py:381: size=185 KiB, count=779, average=243 B
/usr/lib/python3.4/unittest/case.py:402: size=154 KiB, count=378, average=416 B
/usr/lib/python3.4/abc.py:133: size=88.7 KiB, count=347, average=262 B
<frozen importlib._bootstrap>:1446: size=70.4 KiB, count=911, average=79 B
<frozen importlib._bootstrap>:1454: size=52.0 KiB, count=25, average=2131 B
<string>:5: size=49.7 KiB, count=148, average=344 B
/usr/lib/python3.4/sysconfig.py:411: size=48.0 KiB, count=1, average=48.0 KiB
```

We can see that Python loaded 4.8 MiB data (bytecode and constants) from modules and that the collections module allocated 244 KiB to build namedtuple types.

See `Snapshot.statistics()` for more options.

Compute differences

Take two snapshots and display the differences:

```
import tracemalloc
tracemalloc.start()
# ... start your application ...

snapshot1 = tracemalloc.take_snapshot()
# ... call the function leaking memory ...
snapshot2 = tracemalloc.take_snapshot()

top_stats = snapshot2.compare_to(snapshot1, 'lineno')
```

```
print("[ Top 10 differences ]")
for stat in top_stats[:10]:
    print(stat)
```

Example of output before/after running some tests of the Python test suite:

```
[ Top 10 differences ]
<frozen importlib._bootstrap>:716: size=8173 KiB (+4428 KiB), count=71332 (+39369),
↪average=117 B
/usr/lib/python3.4/linecache.py:127: size=940 KiB (+940 KiB), count=8106 (+8106),
↪average=119 B
/usr/lib/python3.4/unittest/case.py:571: size=298 KiB (+298 KiB), count=589 (+589),
↪average=519 B
<frozen importlib._bootstrap>:284: size=1005 KiB (+166 KiB), count=7423 (+1526),
↪average=139 B
/usr/lib/python3.4/mimetypes.py:217: size=112 KiB (+112 KiB), count=1334 (+1334),
↪average=86 B
/usr/lib/python3.4/http/server.py:848: size=96.0 KiB (+96.0 KiB), count=1 (+1),
↪average=96.0 KiB
/usr/lib/python3.4/inspect.py:1465: size=83.5 KiB (+83.5 KiB), count=109 (+109),
↪average=784 B
/usr/lib/python3.4/unittest/mock.py:491: size=77.7 KiB (+77.7 KiB), count=143 (+143),
↪average=557 B
/usr/lib/python3.4/urllib/parse.py:476: size=71.8 KiB (+71.8 KiB), count=969 (+969),
↪average=76 B
/usr/lib/python3.4/contextlib.py:38: size=67.2 KiB (+67.2 KiB), count=126 (+126),
↪average=546 B
```

We can see that Python has loaded 8.2 MiB of module data (bytecode and constants), and that this is 4.4 MiB more than had been loaded before the tests, when the previous snapshot was taken. Similarly, the linecache module has cached 940 KiB of Python source code to format tracebacks, all of it since the previous snapshot.

If the system has little free memory, snapshots can be written on disk using the `Snapshot.dump()` method to analyze the snapshot offline. Then use the `Snapshot.load()` method reload the snapshot.

Get the traceback of a memory block

Code to display the traceback of the biggest memory block:

```
import tracemalloc

# Store 25 frames
tracemalloc.start(25)

# ... run your application ...

snapshot = tracemalloc.take_snapshot()
top_stats = snapshot.statistics('traceback')

# pick the biggest memory block
stat = top_stats[0]
print("%s memory blocks: %.1f KiB" % (stat.count, stat.size / 1024))
for line in stat.traceback.format():
    print(line)
```

Example of output of the Python test suite (traceback limited to 25 frames):

```

903 memory blocks: 870.1 KiB
File "<frozen importlib._bootstrap>", line 716
File "<frozen importlib._bootstrap>", line 1036
File "<frozen importlib._bootstrap>", line 934
File "<frozen importlib._bootstrap>", line 1068
File "<frozen importlib._bootstrap>", line 619
File "<frozen importlib._bootstrap>", line 1581
File "<frozen importlib._bootstrap>", line 1614
File "/usr/lib/python3.4/doctest.py", line 101
    import pdb
File "<frozen importlib._bootstrap>", line 284
File "<frozen importlib._bootstrap>", line 938
File "<frozen importlib._bootstrap>", line 1068
File "<frozen importlib._bootstrap>", line 619
File "<frozen importlib._bootstrap>", line 1581
File "<frozen importlib._bootstrap>", line 1614
File "/usr/lib/python3.4/test/support/__init__.py", line 1728
    import doctest
File "/usr/lib/python3.4/test/test_pickletools.py", line 21
    support.run_doctest(pickletools)
File "/usr/lib/python3.4/test/regrtest.py", line 1276
    test_runner()
File "/usr/lib/python3.4/test/regrtest.py", line 976
    display_failure=not verbose)
File "/usr/lib/python3.4/test/regrtest.py", line 761
    match_tests=ns.match_tests)
File "/usr/lib/python3.4/test/regrtest.py", line 1563
    main()
File "/usr/lib/python3.4/test/__main__.py", line 3
    regrtest.main_in_temp_cwd()
File "/usr/lib/python3.4/runpy.py", line 73
    exec(code, run_globals)
File "/usr/lib/python3.4/runpy.py", line 160
    "__main__", fname, loader, pkg_name)

```

We can see that the most memory was allocated in the `importlib` module to load data (bytecode and constants) from modules: 870 KiB. The traceback is where the `importlib` loaded data most recently: on the `import pdb` line of the `doctest` module. The traceback may change if a new module is loaded.

Pretty top

Code to display the 10 lines allocating the most memory with a pretty output, ignoring `<frozen importlib._bootstrap>` and `<unknown>` files:

```

import os
import tracemalloc

def display_top(snapshot, group_by='lineno', limit=10):
    snapshot = snapshot.filter_traces((
        tracemalloc.Filter(False, "<frozen importlib._bootstrap>"),
        tracemalloc.Filter(False, "<unknown>"),
    ))
    top_stats = snapshot.statistics(group_by)

    print("Top %s lines" % limit)
    for index, stat in enumerate(top_stats[:limit], 1):

```

```
frame = stat.traceback[0]
# replace "/path/to/module/file.py" with "module/file.py"
filename = os.sep.join(frame.filename.split(os.sep)[-2:])
print("#%s: %s:%s: %.1f KiB"
      % (index, filename, frame.lineno,
         stat.size / 1024))

other = top_stats[limit:]
if other:
    size = sum(stat.size for stat in other)
    print("%s other: %.1f KiB" % (len(other), size / 1024))
total = sum(stat.size for stat in top_stats)
print("Total allocated size: %.1f KiB" % (total / 1024))

tracemalloc.start()

# ... run your application ...

snapshot = tracemalloc.take_snapshot()
display_top(snapshot)
```

Example of output of the Python test suite:

```
2013-11-08 14:16:58.149320: Top 10 lines
#1: collections/__init__.py:368: 291.9 KiB
#2: Lib/doctest.py:1291: 200.2 KiB
#3: unittest/case.py:571: 160.3 KiB
#4: Lib/abc.py:133: 99.8 KiB
#5: urllib/parse.py:476: 71.8 KiB
#6: <string>:5: 62.7 KiB
#7: Lib/base64.py:140: 59.8 KiB
#8: Lib/_weakrefset.py:37: 51.8 KiB
#9: collections/__init__.py:362: 50.6 KiB
#10: test/test_site.py:56: 48.0 KiB
7496 other: 4161.9 KiB
Total allocated size: 5258.8 KiB
```

See `Snapshot.statistics()` for more options.

Thread to write snapshots into files every minutes

Create a daemon thread writing snapshots every minutes into `/tmp/tracemalloc-PPP-CCCC.pickle` where PPP is the identifier of the process and CCCC is a counter:

```
import pickle, gc, os, signal, threading, time, tracemalloc

class TakeSnapshot(threading.Thread):
    daemon = True

    def run(self):
        if hasattr(signal, 'pthread_sigmask'):
            # Available on UNIX with Python 3.3+
            signal.pthread_sigmask(signal.SIG_BLOCK, range(1, signal.NSIG))
        counter = 1
        while True:
            time.sleep(60)
            filename = ("/tmp/tracemalloc-%d-%04d.pickle"
```

```

        % (os.getpid(), counter))
    print("Write snapshot into %s.." % filename)
    gc.collect()
    snapshot = tracemalloc.take_snapshot()
    with open(filename, "wb") as fp:
        # Pickle version 2 can be read by Python 2 and Python 3
        pickle.dump(snapshot, fp, 2)
    snapshot = None
    print("Snapshot written into %s" % filename)
    counter += 1

# save 25 frames
tracemalloc.start(25)
TakeSnapshot().start()

```

API

The version of the module is `tracemalloc.__version__` (string), example: "1.2".

Functions

`clear_traces()`

Clear traces of memory blocks allocated by Python.

See also `stop()`.

`get_object_traceback(obj)`

Get the traceback where the Python object *obj* was allocated. Return a `Traceback` instance, or `None` if the `tracemalloc` module is not tracing memory allocations or did not trace the allocation of the object.

See also `gc.get_referrers()` and `sys.getsizeof()` functions.

`get_traceback_limit()`

Get the maximum number of frames stored in the traceback of a trace.

The `tracemalloc` module must be tracing memory allocations to get the limit, otherwise an exception is raised.

The limit is set by the `start()` function.

`get_traced_memory()`

Get the current size and peak size of memory blocks traced by the `tracemalloc` module as a tuple: (current: int, peak: int).

`get_tracemalloc_memory()`

Get the memory usage in bytes of the `tracemalloc` module used to store traces of memory blocks. Return an int.

`is_tracing()`

True if the `tracemalloc` module is tracing Python memory allocations, False otherwise.

See also `start()` and `stop()` functions.

`start(nframe: int=1)`

Start tracing Python memory allocations: install hooks on Python memory allocators. Collected tracebacks of traces will be limited to *nframe* frames. By default, a trace of a memory block only stores the most recent frame: the limit is 1. *nframe* must be greater or equal to 1.

Storing more than 1 frame is only useful to compute statistics grouped by 'traceback' or to compute cumulative statistics: see the `Snapshot.compare_to()` and `Snapshot.statistics()` methods.

Storing more frames increases the memory and CPU overhead of the `tracemalloc` module. Use the `get_tracemalloc_memory()` function to measure how much memory is used by the `tracemalloc` module.

See also `stop()`, `is_tracing()` and `get_traceback_limit()` functions.

stop()

Stop tracing Python memory allocations: uninstall hooks on Python memory allocators. Also clears all previously collected traces of memory blocks allocated by Python.

Call `take_snapshot()` function to take a snapshot of traces before clearing them.

See also `start()`, `is_tracing()` and `clear_traces()` functions.

take_snapshot()

Take a snapshot of traces of memory blocks allocated by Python. Return a new `Snapshot` instance.

The snapshot does not include memory blocks allocated before the `tracemalloc` module started to trace memory allocations.

Tracebacks of traces are limited to `get_traceback_limit()` frames. Use the `nframe` parameter of the `start()` function to store more frames.

The `tracemalloc` module must be tracing memory allocations to take a snapshot, see the `start()` function.

See also the `get_object_traceback()` function.

Filter

class Filter (*inclusive: bool, filename_pattern: str, lineno: int=None, all_frames: bool=False*)

Filter on traces of memory blocks.

See the `fnmatch.fnmatch()` function for the syntax of `filename_pattern`. The `'.pyc'` and `'.pyo'` file extensions are replaced with `'.py'`.

Examples:

- `Filter(True, subprocess.__file__)` only includes traces of the subprocess module
- `Filter(False, tracemalloc.__file__)` excludes traces of the `tracemalloc` module
- `Filter(False, "<unknown>")` excludes empty tracebacks

inclusive

If `inclusive` is `True` (include), only trace memory blocks allocated in a file with a name matching `filename_pattern` at line number `lineno`.

If `inclusive` is `False` (exclude), ignore memory blocks allocated in a file with a name matching `filename_pattern` at line number `lineno`.

lineno

Line number (`int`) of the filter. If `lineno` is `None`, the filter matches any line number.

filename_pattern

Filename pattern of the filter (`str`).

all_frames

If `all_frames` is `True`, all frames of the traceback are checked. If `all_frames` is `False`, only the most recent frame is checked.

This attribute has no effect if the traceback limit is 1. See the `get_traceback_limit()` function and `Snapshot.traceback_limit` attribute.

Frame

class `Frame`

Frame of a traceback.

The `Traceback` class is a sequence of `Frame` instances.

filename

Filename (str).

lineno

Line number (int).

Snapshot

class `Snapshot`

Snapshot of traces of memory blocks allocated by Python.

The `take_snapshot()` function creates a snapshot instance.

compare_to (*old_snapshot: Snapshot, group_by: str, cumulative: bool=False*)

Compute the differences with an old snapshot. Get statistics as a sorted list of `StatisticDiff` instances grouped by `group_by`.

See the `statistics()` method for `group_by` and `cumulative` parameters.

The result is sorted from the biggest to the smallest by: absolute value of `StatisticDiff.size_diff`, `StatisticDiff.size`, absolute value of `StatisticDiff.count_diff`, `StatisticDiff.count` and then by `StatisticDiff.traceback`.

dump (*filename*)

Write the snapshot into a file.

Use `load()` to reload the snapshot.

filter_traces (*filters*)

Create a new `Snapshot` instance with a filtered `traces` sequence, `filters` is a list of `Filter` instances. If `filters` is an empty list, return a new `Snapshot` instance with a copy of the traces.

All inclusive filters are applied at once, a trace is ignored if no inclusive filters match it. A trace is ignored if at least one exclusive filter matches it.

classmethod load (*filename*)

Load a snapshot from a file.

See also `dump()`.

statistics (*group_by: str, cumulative: bool=False*)

Get statistics as a sorted list of `Statistic` instances grouped by `group_by`:

group_by	description
'filename'	filename
'lineno'	filename and line number
'traceback'	traceback

If *cumulative* is `True`, cumulate size and count of memory blocks of all frames of the traceback of a trace, not only the most recent frame. The cumulative mode can only be used with *group_by* equals to `'filename'` and `'lineno'`.

The result is sorted from the biggest to the smallest by: *Statistic.size*, *Statistic.count* and then by *Statistic.traceback*.

traceback_limit

Maximum number of frames stored in the traceback of *traces*: result of the *get_traceback_limit()* when the snapshot was taken.

traces

Traces of all memory blocks allocated by Python: sequence of *Trace* instances.

The sequence has an undefined order. Use the *Snapshot.statistics()* method to get a sorted list of statistics.

Statistic

class Statistic

Statistic on memory allocations.

Snapshot.statistics() returns a list of *Statistic* instances.

See also the *StatisticDiff* class.

count

Number of memory blocks (*int*).

size

Total size of memory blocks in bytes (*int*).

traceback

Traceback where the memory block was allocated, *Traceback* instance.

StatisticDiff

class StatisticDiff

Statistic difference on memory allocations between an old and a new *Snapshot* instance.

Snapshot.compare_to() returns a list of *StatisticDiff* instances. See also the *Statistic* class.

count

Number of memory blocks in the new snapshot (*int*): 0 if the memory blocks have been released in the new snapshot.

count_diff

Difference of number of memory blocks between the old and the new snapshots (*int*): 0 if the memory blocks have been allocated in the new snapshot.

size

Total size of memory blocks in bytes in the new snapshot (*int*): 0 if the memory blocks have been released in the new snapshot.

size_diff

Difference of total size of memory blocks in bytes between the old and the new snapshots (*int*): 0 if the memory blocks have been allocated in the new snapshot.

traceback

Traceback where the memory blocks were allocated, *Traceback* instance.

Trace

class `Trace`

Trace of a memory block.

The `Snapshot.traces` attribute is a sequence of `Trace` instances.

`size`

Size of the memory block in bytes (`int`).

`traceback`

Traceback where the memory block was allocated, `Traceback` instance.

Traceback

class `Traceback`

Sequence of `Frame` instances sorted from the most recent frame to the oldest frame.

A traceback contains at least 1 frame. If the `tracemalloc` module failed to get a frame, the filename "`<unknown>`" at line number 0 is used.

When a snapshot is taken, tracebacks of traces are limited to `get_traceback_limit()` frames. See the `take_snapshot()` function.

The `Trace.traceback` attribute is an instance of `Traceback` instance.

Differences between `pytracemalloc` (PyPI) and `tracemalloc` (stdlib)

The `tracemalloc` module is part of the Python standard library since Python 3.4: read [tracemalloc module documentation](#).

There are differences between the third party `pytracemalloc` module (downloaded from PyPI) and the `tracemalloc` which is part of the Python standard library:

- `stdlib tracemalloc` supports a `PYTHONTRACEMALLOC` environment variable to start tracing at Python startup.
- `stdlib tracemalloc` supports a `-X tracemalloc=NFRAMES` command line option to start tracing at Python startup.

tracemallocqt: GUI to analyze snapshots

`tracemallocqt` is graphical interface to analyze `tracemalloc` snapshots. It uses the Qt toolkit.

- [tracemallocqt project at Bitbucket](#)

Usage

Analyze a single snapshot:

```
./tracemallocqt.py snapshot.pickle
```

Compare two snapshots:

```
./tracemallocqt.py snapshot1.pickle snapshot2.pickle
```

You can pass more snapshots and then use the checkbox to select which snapshots are compared. The snapshots are sorted by the modification time of the files.

Installation

There is no release yet, you have to clone the Mercurial repository:

```
hg clone https://bitbucket.org/haypo/tracemallocqt
```

tracemallocqt works on Python 2 and 3 and requires PyQt4 or PySide.

Screenshots

Traces grouped by line number

The screenshot shows the Tracemalloc application window. At the top, there are navigation buttons for 'Previous' and 'Next'. Below that, two snapshots are selected for comparison: 'tracemalloc-351-0002.pickle (12.0 MiB, 91096 traces, 2014-03-12 18:42:01)' and 'tracemalloc-351-0021.pickle (67.0 MiB, 491921 traces, 2014-03-12 18:52:21)'. A 'Load' button is to the right. Below the snapshots, the 'Group by' dropdown is set to 'Line number', and there is an unchecked checkbox for 'Cumulative sizes' and 'Filters: (none)'. A table displays the comparison results:

Line	Size	Size Diff ▲	Count	Count Diff	Item Size	%Total
<frozen importlib._bootstrap>:656	19.0 MiB	+14.0 MiB	166052	+116214	121 B	28.3 %
<frozen importlib._bootstrap>:321	10.0 MiB	+10144 KiB	104375	+100355	105 B	15.5 %
.../default/Lib/linecache.py:127	3223 KiB	+2535 KiB	28313	+22414	116 B	4.6 %
.../Lib/unittest/case.py:574	1054 KiB	+54 KiB	4731	+4134	509 B	3.4 %
.../Lib/test/test_enumerate.py:150	1698 KiB	+1698 KiB	29533	+29533	58 B	2.5 %
.../Lib/test/test_datetime.py:32	1248 KiB	+1248 KiB	27	+27	46.0 KiB	1.8 %

Below the table, it says 'Lines: 35414 - Total: 67.0 MiB (+55.0 MiB)'. At the bottom, a code editor shows the source code for the selected line in linecache.py:

```
122:         pass
123:     else:
124:         return []
125:     try:
126:         with tokenize.open(fullname) as fp:
127:             lines = fp.readlines()
128:     except OSError:
129:         return []
130:     if lines and not lines[-1].endswith('\n'):
131:         lines[-1] += '\n'
132:     size, mtime = stat.st_size, stat.st_mtime
133:     cache[filename] = size, mtime, lines, fullname
134:     return lines
```

Traces grouped by traceback

The screenshot shows the Tracemalloc application window. At the top, there are two snapshots selected for comparison: 'tracemalloc-351-0002.pickle (12.0 MiB, 91096 traces, 2014-03-12 18:42:01)' and 'tracemalloc-351-0021.pickle (67.0 MiB, 491921 traces, 2014-03-12 18:52:21)'. The 'Group by' dropdown is set to 'Traceback'. Below this is a table with columns for 'Traceback', 'Size', and 'Size Diff'. The first row is highlighted in yellow and shows a traceback for linecache.py:127, with a size of 618 KiB and a size difference of +618 KiB. A tooltip window is open over this row, displaying the traceback details. The tooltip shows the following code:

```

Traceback (most recent first):
/home/haypo/prog/python/default/Lib/linecache.py:127
  lines = fp.readlines()
/home/haypo/prog/python/default/Lib/linecache.py:41
  return updatecache(filename, module_globals)
/home/haypo/prog/python/default/Lib/doctest.py:905
  source_lines = linecache.getlines(file, module.__dict__)
/home/haypo/prog/python/default/Lib/doctest.py:1944
  for test in finder.find(m, name, globs=globs, extraglobs=extraglobs):
/home/haypo/prog/python/default/Lib/test/support/__init__.py:1759
  f, t = doctest.testmod(module, verbose=verbosity,
optionflags=optionflags)
/home/haypo/prog/python/default/Lib/test/test_decimal.py:5455
  run_doctest(C, verbose, optionflags=IGNORE_EXCEPTION_DETAIL)
/home/haypo/prog/python/default/Lib/test/regtest.py:1278
  test_runner()
/home/haypo/prog/python/default/Lib/test/regtest.py:978
  display_failure=not verbose)
/home/haypo/prog/python/default/Lib/test/regtest.py:763
  match_tests=ns.match_tests)
/home/haypo/prog/python/default/Lib/test/regtest.py:1562
  main()
Lib/test/__main__.py:3
/home/haypo/prog/python/default/Lib/runpy.py:86
  return run_globals
/home/haypo/prog/python/default/Lib/runpy.py:258
  finally:
/home/haypo/prog/GIT/pytracemalloc/tracemalloc_runner.py:76
  128:     except OSError:
  129:         return []
  130:     if lines and not lines[-1].endswith('\n'):
  131:         lines[-1] += '\n'
  132:     size_mtime = stat.st_size, stat.st_mtime

```

Below the table, there is a list of file paths for the traces, including linecache.py, doctest.py, test/support/__init__.py, test/test_decimal.py, test/regtest.py, and Lib/test/__main__.py.

Changelog

Version 1.2 (2014-10-15)

- filter_traces() now raises a TypeError if filters is not an iterable
- Update Python 2.7 patch to try to keep the ABI unchanged, especially for Python compiled in debug mode (./configure --with-pydebug)
- Support Python 2.6
- Enhance the documentation (website)

Version 1.0 (2014-03-05)

- Python issue #20616: Add a format() method to tracemalloc.Traceback.
- Python issue #20354: Fix alignment issue in the tracemalloc module on 64-bit platforms. Bug seen on 64-bit Linux when using “make profile-opt”.
- Fix slicing traces and fix slicing a traceback.

Version 1.0beta1 (2013-12-14)

- A trace of a memory block can now contain more than 1 frame, a whole traceback instead of just the most recent frame
- The malloc hook API has been proposed as the PEP 445. The PEP has been accepted and implemented in Python 3.4.
- The tracemalloc module has been proposed as the PEP 454. After many reviews, the PEP has been accepted and the code has been merged into Python 3.4.
- The code has been almost fully rewritten from scratch between the version 0.9.1 and 1.0. The tracemalloc has now a completely different API:
 - DisplayTop, TakeSnapshot and DisplayGarbage classes have been removed
 - Rename enable/disable to start/stop
 - start() now takes an optional nframe parameter which is the maximum number of frames stored in a trace of a memory block
 - Raw traces are accessible in Snapshot.traces
 - The get_process_memory() has been removed, but new functions are added like get_traced_memory()
- The glib hashtable has been replaced by a builtin hashtable based on the libcfu library. The glib dependency has been removed so it should be easier to install the module (ex: on Windows).

Version 0.9.1 (2013-06-01)

- Add PYTRACEMALLOC environment variable to trace memory allocation as early as possible at Python startup
- Disable the timer while calling its callback to not call the callback while it is running
- Fix pythonXXX_track_free_list.patch patches for zombie frames
- Use also MiB, GiB and TiB units to format a size, not only B and KiB

Version 0.9 (2013-05-31)

- Tracking free lists is now the recommended method to patch Python
- Fix code tracking Python free lists and python2.7_track_free_list.patch
- Add patches tracking free lists for Python 2.5.2 and 3.4.

Version 0.8.1 (2013-03-23)

- Fix python2.7.patch and python3.4.patch when Python is not compiled in debug mode (without `-with-pydebug`)
- Fix DisplayTop: display “0 B” instead of an empty string if the size is zero (ex: trace in user data)
- setup.py automatically detects which patch was applied on Python

Version 0.8 (2013-03-19)

- The top uses colors and displays also the memory usage of the process
- Add `DisplayGarbage` class
- Add `get_process_memory()` function
- Support collecting arbitrary user data using a callback: `Snapshot.create()`, `DisplayTop` and `TakeSnapshot` have has an optional `user_data_callback` parameter/attribute
- Display the name of the previous snapshot when comparing two snapshots
- Command line (`-m tracemalloc`):
 - Add `--color` and `--no-color` options
 - `--include` and `--exclude` command line options can now be specified multiple times
- Automatically disable `tracemalloc` at exit
- Remove `get_source()` and `get_stats()` functions: they are now private

Version 0.7 (2013-03-04)

- First public version

CHAPTER 2

Status of the module

pytracemalloc 1.0 contains patches for Python 2.7 and 3.3. The version 1.0 has been tested on Linux with Python 2.7 and 3.3: unit tests passed.
