This library offers an implementation of the `skosprovider.providers.VocabularyProvider` interface that uses an [RDFlib](#) graph as input.

---

## Introduction

---

### 1.1 Installation

To be able to use this library you need to have a modern version of Python installed. Currently we're supporting versions 2.7, 3.3 and 3.4 of Python.

This easiest way to install this library is through **pip** or **easy install**:

```
$ pip install skosprovider_rdf
```

This will download and install `skosprovider_rdf` and a few libraries it depends on.

### 1.2 Usage

This library offers an implementation of the `skosprovider.providers.VocabularyProvider` interface that uses an `rdflib.graph.Graph` as input. This provider can be used to add a *SKOS* vocabulary contained in an *RDF* file to your application. The provider itself does not read the *SKOS* file, but expects to be passed a *Graph*. So any type of *RDF* serialisation that can be read by `rdflib`, can be used with this provider.

```
# -*- coding: utf-8 -*-

import os

from rdflib import Graph

from skosprovider_rdf.providers import RDFProvider

graph = Graph()

file = os.path.join(os.path.dirname(__file__), '..', 'tests', 'data', 'simple_turtle_products')
graph.parse(file, format="turtle")

provider = RDFProvider(
    {'id': 'PRODUCTS'},
    graph
)

print "provider.get_all()"
print "-----"
print provider.get_all()
print ""
```

```
print "provider.find({'label': 'jewelry'})"
print "-----"
print provider.find({'label': 'jewelry'})
print ""

print "provider.get_by_id('http://www.products.com/Jewellery')"
print "-----"
print provider.get_by_id('http://www.products.com/Jewellery')
print ""

print "provider.get_by_uri('http://www.products.com/Jewellery')"
print "-----"
print provider.get_by_uri('http://www.products.com/Jewellery')
print ""
```

It also provides a utility function to dump any implementation of `skosprovider.providers.VocabularyProvider` to a `rdflib.graph.Graph`. Again, since the provider only deals with the `Graph` object, it's possible to serialise a `VocabularyProvider` to whatever RDF serialisations `rdflib` allows.

```
# -*- coding: utf-8 -*-
'''
This script demonstrates dumping a
:class:`skosprovider.providers.SimpleCsvProvider` as a RDF Graph. In this
case, `n3` serialisation is used, other serialisations are available through
:mod:`rdflib`.
'''

import os
import csv

from skosprovider.providers import SimpleCsvProvider

from skosprovider.uri import UriPatternGenerator

from skosprovider.skos import ConceptScheme, Label, Note, Source

from skosprovider_rdf.utils import rdf_dumper

ifile = open(
    os.path.join(os.path.dirname(__file__), 'data', 'menu.csv'),
    "r"
)

reader = csv.reader(ifile)

csvprovider = SimpleCsvProvider(
    {'id': 'MENU'},
    reader,
    uri_generator=UriPatternGenerator('http://id.python.org/menu/%s'),
    concept_scheme=ConceptScheme(
        uri='http://id.python.org/menu',
        labels=[
            Label(type='prefLabel', language='en', label='A pythonesque menu.')
        ],
        notes=[
            Note(
                type='changeNote',
```

```
        language='en',
        note="<strong>We didn't need no change notes when I was younger.</strong>",
        markup='HTML'
    )
],
sources=[
    Source("Monthy Python's Flying Circus, 1970. Spam.")
]
)
)

graph = rdf_dumper(csvprovider)

print graph.serialize(format='n3')
```

---

## Development

---

skosprovider\_rdf is being developed by the [Flanders Heritage Agency](#).

Since we place a lot of importance of code quality, we expect to have a good amount of code coverage present and run frequent unit tests. All commits and pull requests will be tested with [Travis-ci](#). Code coverage is being monitored with [Coveralls](#).

Locally you can run unit tests by using [pytest](#) or [tox](#). Running pytest manually is good for running a distinct set of unit tests. For a full test run, tox is preferred since this can run the unit tests against multiple versions of python.

```
# Setup for development
$ python setup.py develop
# Run unit tests for all environments
$ tox
# No coverage
$ py.test
# Coverage
$ py.test --cov skosprovider_rdf --cov-report term-missing tests
# Only run a subset of the tests
$ py.test skosprovider_rdf/tests/test_providers.py
```

Please provide new unit tests to maintain 100% coverage. If you send us a pull request and this build doesn't function, please correct the issue at hand or let us know why it's not working.

---

## API Documentation

---

### 3.1 Providers module

This module contains an `RDFProvider`, an implementation of the `skosprovider.providers.VocabularyProvider` interface that uses a `rdflib.graph.Graph` as input.

**class** `skosprovider_rdf.providers.RDFProvider` (*metadata, graph, \*\*kwargs*)

A simple vocabulary provider that use an `rdflib.graph.Graph` as input. The provider expects a RDF graph with elements that represent the SKOS concepts and collections.

Please be aware that this provider needs to load the entire graph in memory.

**to\_text** (*data*)

data of binary type or literal type that needs to be converted to text. :param data :return: text representation of the data

### 3.2 Utils module

This module contains utility functions for dealing with skos providers.

`skosprovider_rdf.utils.extract_language` (*lang*)

Turn a language in our domain model into a IANA tag.

`skosprovider_rdf.utils.rdf_c_dumper` (*provider, c*)

Dump one concept or collection from a provider to a format that can be passed to a `skosprovider.providers.RDFProvider`.

**Parameters**

- **provider** (`skosprovider.providers.VocabularyProvider`) – The provider that wil be turned into an `rdflib.graph.Graph`.
- **c** (`String`) – identifier

**Return type** `rdflib.graph.Graph`

`skosprovider_rdf.utils.rdf_conceptscheme_dumper` (*provider*)

Dump all information of the conceptscheme of a provider to a format that can be passed to a `skosprovider.providers.RDFProvider`.

**Parameters** **provider** (`skosprovider.providers.VocabularyProvider`) – The provider that wil be turned into an `rdflib.graph.Graph`.

**Return type** `rdflib.graph.Graph`

skosprovider\_rdf.utils.**rdf\_dumper** (*provider*)

Dump a provider to a format that can be passed to a skosprovider.providers.RDFProvider.

**Parameters** **provider** (*skosprovider.providers.VocabularyProvider*) – The provider that will be turned into an rdflib.graph.Graph.

**Return type** rdflib.graph.Graph

skosprovider\_rdf.utils.**text\_** (*s*, *encoding=u'latin-1'*, *errors=u'strict'*)

If *s* is an instance of `binary_type`, return `s.decode(encoding, errors)`, otherwise return *s*

### 4.1 0.6.0 (??-??-2016)

- Compatible with `SkosProvider` 0.6.1.
- Add information about the `void.Dataset` when dumping to RDF.

### 4.2 0.5.0 (11-08-2016)

- Compatible with `SkosProvider` 0.6.0.
- Add official python 3.5 compatibility.
- Add support for sources when dumping to RDF and reading from RDF. (#17)
- Add support for languages to conceptschemes when dumping to and reading from RDF. (#16)
- Add support for HTML in SKOS notes and sources. (#15, #20)

### 4.3 0.4.1 (17-07-2015)

- RDF dump: Add the top concepts and the conceptscheme identifier in the full RDF dump (equal to the RDF conceptscheme dump).
- RDF provider: literal and binary type to text when parsing the graph to a list.

### 4.4 0.4.0 (03-03-2015)

- Allow dumping a single conceptscheme to RDF. This does not dump the entire conceptscheme with all it's concepts or collections, just information on the conceptscheme itself and it's top concepts.
- Allow dumping a single concept or collection to RDF, and not just an entire conceptscheme with all concepts or collections.
- Add `skos:inScheme` information to RDF dumps.
- Better handling of `dc(t):identifier`. When reading an RDF file both `dcterms:identifier` and `dc:identifier` are considered when analysing the identifier. During dumping, we also dump to `dcterms:identifier`.

## 4.5 0.3.0 (19-12-2014)

- Compatible with `SkosProvider 0.5.0`.
- Dumping to an RDF file now also dumps information on the Conceptscheme.
- Dumping to an RDF file now also adds notes to a Collection, not just to a Concept.
- Now handles `subordinate_array` and `superordinate` concept.

## 4.6 0.2.0 (14-10-2014)

- Add support for Dublin Core identifier (#5)

## 4.7 0.1.3 (02-09-2014)

- Fix a namespace error for SKOS Notes. (#2)

## 4.8 0.1.2 (31-07-2014)

- Documentation fixes and cleanup
- Removed RDFlib artefacts from output.

## 4.9 0.1.1 (20-05-2014)

- Bugfixing
- encoding/decoding problems
- casting rdf subjects and objects to rdf:URI's
- Added tests

## 4.10 0.1.0

- Initial version

---

Glossary

---

**RDF** *Resource Description Framework*. A very flexible model for data definition organised around *triples*. These triples forms a directed, labeled graph, where the edges represent the named link between two resources, represented by the graph nodes.

**SKOS** *Simple Knowledge Organization System*. An general specification for Knowledge Organisation Systems (thesauri, word lists, authority files, ...) that is commonly serialised as *RDF*.

**URI** A *Uniform Resource Identifier*.

**URN** A URN is a specific form of a *URI*.

---

## Indices and tables

---

- `genindex`
- `modindex`
- `search`

**S**

skosprovider\_rdf.providers, 9  
skosprovider\_rdf.utils, 9

## E

`extract_language()` (in module `skosprovider_rdf.utils`), 9

## R

**RDF, 13**

`rdf_c_dumper()` (in module `skosprovider_rdf.utils`), 9

`rdf_conceptscheme_dumper()` (in module `skosprovider_rdf.utils`), 9

`rdf_dumper()` (in module `skosprovider_rdf.utils`), 9

`RDFProvider` (class in `skosprovider_rdf.providers`), 9

## S

**SKOS, 13**

`skosprovider_rdf.providers` (module), 9

`skosprovider_rdf.utils` (module), 9

## T

`text_()` (in module `skosprovider_rdf.utils`), 10

`to_text()` (`skosprovider_rdf.providers.RDFProvider` method), 9
