[API Docs](#) | [GitHub](#) | [Issues](#) | [Pull Requests](#) | [PyPI](#) | [Twitter](#) | [#softlayer](#) on freenode

This is the documentation to SoftLayer's Python API Bindings. These bindings use SoftLayer's [XML-RPC](#) interface in order to manage SoftLayer services.

### 1.1 What's Included

When you install `softlayer-python` you will get the following:

- a python package called 'SoftLayer' (casing is important) available in your python path.
- a command-line client placed in your system path named 'slcli'.

### 1.2 Using Pip

Install via pip:

```
$ pip install softlayer
```

### 1.3 Debian/Ubuntu

For Debian “jessie” (currently testing) and Ubuntu 14.04, official system packages are available. **These are typically a couple versions behind so it is recommended to install from pypi if problems are encountered.**

```
$ sudo apt-get install python-softlayer
```

### 1.4 From Source

The project is developed on GitHub, at <https://github.com/softlayer/softlayer-python>.

Install from source via pip (requires git):

```
$ pip install git+git://github.com/softlayer/softlayer-python.git
```

You can clone the public repository:

```
$ git clone git@github.com:softlayer/softlayer-python.git
```

Or, Download the [tarball](#):

```
$ curl -OL https://github.com/softlayer/softlayer-python/tarball/master
```

Or, download the [zipball](#):

```
$ curl -OL https://github.com/softlayer/softlayer-python/zipball/master
```

Once you have a copy of the source you can install it with one of the following commands:

```
$ python setup.py install
```

Or:

```
$ pip install .
```

For more information about working with the source, or contributing to the project, please see the [Contribution Guide](#).

---

### Configuration File

---

The SoftLayer API bindings load your settings from a number of different locations.

- Input directly into `SoftLayer.create_client_from_env(...)`
- Environment variables (`SL_USERNAME`, `SL_API_KEY`)
- Config file locations (`~/.softlayer`, `/etc/softlayer.conf`)
- Or argument (`-C/path/to/config` or `-config=/path/to/config`)

The configuration file is INI-based and requires the `softlayer` section to be present. The only required fields are `username` and `api_key`. You can optionally supply the `endpoint_url` as well. This file is created automatically by the `slcli setup` command detailed here: [Configuration Setup](#).

#### *Config Example*

```
[softlayer]
username = username
api_key = oyVmeipYQCNrjVS4rF9bHWV7D75S6pa1fghF1384v7mwRCbHTfuJ8qRORIqoVnha
endpoint_url = https://api.softlayer.com/xmlrpc/v3/
timeout = 40
```

This is the primary API client to make API calls. It deals with constructing and executing XML-RPC calls against the SoftLayer API. Below are some links that will help to use the SoftLayer API.

- [SoftLayer API Documentation](#)
- [Source on GitHub](#)

```
>>> import SoftLayer
>>> client = SoftLayer.create_client_from_env(username="username", api_key="api_key")
>>> resp = client.call('Account', 'getObject')
>>> resp['companyName']
'Your Company'
```

## 3.1 Getting Started

You can pass in your username and api\_key when creating a SoftLayer client instance. However, you can also set these in the environmental variables 'SL\_USERNAME' and 'SL\_API\_KEY'.

Creating a client instance by passing in the username/api\_key:

```
import SoftLayer
client = SoftLayer.create_client_from_env(username='YOUR_USERNAME', api_key='YOUR_API_
↪KEY')
```

Creating a client instance with environmental variables set:

```
$ export SL_USERNAME=YOUR_USERNAME
$ export SL_API_KEY=YOUR_API_KEY
$ python
>>> import SoftLayer
>>> client = SoftLayer.create_client_from_env()
```

Below is an example of creating a client instance with more options. This will create a client with the private API endpoint (only accessible from the SoftLayer private network) and a timeout of 4 minutes.

```
client = SoftLayer.create_client_from_env(username='YOUR_USERNAME',
                                         api_key='YOUR_API_KEY',
                                         endpoint_url=SoftLayer.API_PRIVATE_ENDPOINT,
                                         timeout=240)
```

## 3.2 Managers

For day-to-day operation, most users will find the managers to be the most convenient means for interacting with the API. Managers abstract a lot of the complexities of using the API into classes that provide a simpler interface to various services. These are higher-level interfaces to the SoftLayer API.

```
from SoftLayer import VSManger, Client
client = Client(...)
vs = VSManger(client)
vs.list_instances()
[...]
```

**Available managers:**

### 3.2.1 SoftLayer.block

Block Storage Manager

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.block.BlockStorageManager` (*client*)  
Manages SoftLayer Block Storage volumes.

See product information here: <http://www.softlayer.com/block-storage>

**Parameters** *client* (`SoftLayer.API.BaseClient`) – the client instance

**authorize\_host\_to\_volume** (*volume\_id*, *hardware\_ids=None*, *virtual\_guest\_ids=None*,  
*ip\_address\_ids=None*, *\*\*kwargs*)  
Authorizes hosts to Block Storage Volumes

**Parameters**

- **volume\_id** – The Block volume to authorize hosts to
- **hardware\_ids** – A List of `SoftLayer_Hardware` ids
- **virtual\_guest\_ids** – A List of `SoftLayer_Virtual_Guest` ids
- **ip\_address\_ids** – A List of `SoftLayer_Network_Subnet_IpAddress` ids

**Returns** Returns an array of `SoftLayer_Network_Storage_Allowed_Host` objects which now have access to the given Block volume

**cancel\_block\_volume** (*volume\_id*, *reason='No longer needed'*, *immediate=False*)  
Cancels the given block storage volume.

**Parameters**

- **volume\_id** (*integer*) – The volume ID
- **reason** (*string*) – The reason for cancellation

- **immediate\_flag** (*boolean*) – Cancel immediately or on anniversary date

**cancel\_snapshot\_space** (*volume\_id, reason='No longer needed', immediate=False*)  
Cancels snapshot space for a given volume.

**Parameters**

- **volume\_id** (*integer*) – The volume ID
- **reason** (*string*) – The reason for cancellation
- **immediate\_flag** (*boolean*) – Cancel immediately or on anniversary date

**create\_or\_update\_lun\_id** (*volume\_id, lun\_id*)  
Set the LUN ID on a volume.

**Parameters**

- **volume\_id** (*integer*) – The id of the volume
- **lun\_id** (*integer*) – LUN ID to set on the volume

**Returns** a SoftLayer\_Network\_Storage\_Property object

**create\_snapshot** (*volume\_id, notes=', \*\*kwargs*)  
Creates a snapshot on the given block volume.

**Parameters**

- **volume\_id** (*integer*) – The id of the volume
- **notes** (*string*) – The notes or “name” to assign the snapshot

**Returns** Returns the id of the new snapshot

**deauthorize\_host\_to\_volume** (*volume\_id, hardware\_ids=None, virtual\_guest\_ids=None, ip\_address\_ids=None, \*\*kwargs*)  
Revokes authorization of hosts to Block Storage Volumes

**Parameters**

- **volume\_id** – The Block volume to deauthorize hosts to
- **hardware\_ids** – A List of SoftLayer\_Hardware ids
- **virtual\_guest\_ids** – A List of SoftLayer\_Virtual\_Guest ids
- **ip\_address\_ids** – A List of SoftLayer\_Network\_Subnet\_IpAddress ids

**Returns** Returns an array of SoftLayer\_Network\_Storage\_Allowed\_Host objects which have access to the given Block volume

**delete\_snapshot** (*snapshot\_id*)  
Deletes the specified snapshot object.

**Parameters** **snapshot\_id** – The ID of the snapshot object to delete.

**disable\_snapshots** (*volume\_id, schedule\_type*)  
Disables snapshots for a specific block volume at a given schedule

**Parameters**

- **volume\_id** (*integer*) – The id of the volume
- **schedule\_type** (*string*) – ‘HOURLY’|‘DAILY’|‘WEEKLY’

**Returns** Returns whether successfully disabled or not

**enable\_snapshots** (*volume\_id*, *schedule\_type*, *retention\_count*, *minute*, *hour*, *day\_of\_week*,  
*\*\*kwargs*)

Enables snapshots for a specific block volume at a given schedule

**Parameters**

- **volume\_id** (*integer*) – The id of the volume
- **schedule\_type** (*string*) – ‘HOURLY’|‘DAILY’|‘WEEKLY’
- **retention\_count** (*integer*) – Number of snapshots to be kept
- **minute** (*integer*) – Minute when to take snapshot
- **hour** (*integer*) – Hour when to take snapshot
- **day\_of\_week** (*string*) – Day when to take snapshot

**Returns** Returns whether successfully scheduled or not

**failback\_from\_replicant** (*volume\_id*, *replicant\_id*)

Failback from a volume replicant.

**Parameters**

- **volume\_id** (*integer*) – The id of the volume
- **replicant\_id** (*integer*) – ID of replicant to failback from

**Returns** Returns whether failback was successful or not

**failover\_to\_replicant** (*volume\_id*, *replicant\_id*, *immediate=False*)

Failover to a volume replicant.

**Parameters**

- **volume\_id** (*integer*) – The id of the volume
- **replicant\_id** (*integer*) – ID of replicant to failover to
- **immediate** (*boolean*) – Flag indicating if failover is immediate

**Returns** Returns whether failover was successful or not

**get\_block\_volume\_access\_list** (*volume\_id*, *\*\*kwargs*)

Returns a list of authorized hosts for a specified volume.

**Parameters**

- **volume\_id** – ID of volume.
- **kwargs** –

**Returns** Returns a list of authorized hosts for a specified volume.

**get\_block\_volume\_details** (*volume\_id*, *\*\*kwargs*)

Returns details about the specified volume.

**Parameters**

- **volume\_id** – ID of volume.
- **kwargs** –

**Returns** Returns details about the specified volume.

**get\_block\_volume\_snapshot\_list** (*volume\_id*, *\*\*kwargs*)

Returns a list of snapshots for the specified volume.

**Parameters**

- **volume\_id** – ID of volume.
- **kwargs** –

**Returns** Returns a list of snapshots for the specified volume.

**get\_replication\_locations** (*volume\_id*)

Acquires list of the datacenters to which a volume can be replicated.

**Parameters** **volume\_id** – The ID of the primary volume to be replicated

**Returns** Returns an array of SoftLayer\_Network\_Storage objects

**get\_replication\_partners** (*volume\_id*)

Acquires list of replicant volumes pertaining to the given volume.

**Parameters** **volume\_id** – The ID of the primary volume to be replicated

**Returns** Returns an array of SoftLayer\_Location objects

**list\_block\_volumes** (*datacenter=None, username=None, storage\_type=None, \*\*kwargs*)

Returns a list of block volumes.

**Parameters**

- **datacenter** – Datacenter short name (e.g.: dal09)
- **username** – Name of volume.
- **storage\_type** – Type of volume: Endurance or Performance
- **kwargs** –

**Returns** Returns a list of block volumes.

**list\_volume\_schedules** (*volume\_id*)

Lists schedules for a given volume

**Parameters** **volume\_id** (*integer*) – The id of the volume

**Returns** Returns list of schedules assigned to a given volume

**order\_block\_volume** (*storage\_type, location, size, os\_type, iops=None, tier\_level=None, snapshot\_size=None, service\_offering='storage\_as\_a\_service', hourly\_billing\_flag=False*)

Places an order for a block volume.

**Parameters**

- **storage\_type** – ‘performance’ or ‘endurance’
- **location** – Datacenter in which to order iSCSI volume
- **size** – Size of the desired volume, in GB
- **os\_type** – OS Type to use for volume alignment, see help for list
- **iops** – Number of IOPs for a “Performance” order
- **tier\_level** – Tier level to use for an “Endurance” order
- **snapshot\_size** – The size of optional snapshot space, if snapshot space should also be ordered (None if not ordered)
- **service\_offering** – Requested offering package to use in the order (‘storage\_as\_a\_service’, ‘enterprise’, or ‘performance’)
- **hourly\_billing\_flag** – Billing type, monthly (False) or hourly (True), default to monthly.

**order\_duplicate\_volume** (*origin\_volume\_id, origin\_snapshot\_id=None, duplicate\_size=None, duplicate\_iops=None, duplicate\_tier\_level=None, duplicate\_snapshot\_size=None, hourly\_billing\_flag=False*)

Places an order for a duplicate block volume.

**Parameters**

- **origin\_volume\_id** – The ID of the origin volume to be duplicated
- **origin\_snapshot\_id** – Origin snapshot ID to use for duplication
- **duplicate\_size** – Size/capacity for the duplicate volume
- **duplicate\_iops** – The IOPS per GB for the duplicate volume
- **duplicate\_tier\_level** – Tier level for the duplicate volume
- **duplicate\_snapshot\_size** – Snapshot space size for the duplicate
- **hourly\_billing\_flag** – Billing type, monthly (False) or hourly (True), default to monthly.

**Returns** Returns a SoftLayer\_Container\_Product\_Order\_Receipt

**order\_modified\_volume** (*volume\_id, new\_size=None, new\_iops=None, new\_tier\_level=None*)

Places an order for modifying an existing block volume.

**Parameters**

- **volume\_id** – The ID of the volume to be modified
- **new\_size** – The new size/capacity for the volume
- **new\_iops** – The new IOPS for the volume
- **new\_tier\_level** – The new tier level for the volume

**Returns** Returns a SoftLayer\_Container\_Product\_Order\_Receipt

**order\_replicant\_volume** (*volume\_id, snapshot\_schedule, location, tier=None, os\_type=None*)

Places an order for a replicant block volume.

**Parameters**

- **volume\_id** – The ID of the primary volume to be replicated
- **snapshot\_schedule** – The primary volume’s snapshot schedule to use for replication
- **location** – The location for the ordered replicant volume
- **tier** – The tier (IOPS per GB) of the primary volume
- **os\_type** – The OS type of the primary volume

**Returns** Returns a SoftLayer\_Container\_Product\_Order\_Receipt

**order\_snapshot\_space** (*volume\_id, capacity, tier, upgrade, \*\*kwargs*)

Orders snapshot space for the given block volume.

**Parameters**

- **volume\_id** (*integer*) – The id of the volume
- **capacity** (*integer*) – The capacity to order, in GB
- **tier** (*float*) – The tier level of the block volume, in IOPS per GB
- **upgrade** (*boolean*) – Flag to indicate if this order is an upgrade

**Returns** Returns a SoftLayer\_Container\_Product\_Order\_Receipt

**resolve\_ids** (*identifier*)

Takes a string and tries to resolve to a list of matching ids.

What exactly 'identifier' can be depends on the resolvers

**Parameters** **identifier** (*string*) – identifying string

**Returns** list

**restore\_from\_snapshot** (*volume\_id, snapshot\_id*)

Restores a specific volume from a snapshot

**Parameters**

- **volume\_id** (*integer*) – The id of the volume
- **snapshot\_id** (*integer*) – The id of the restore point

**Returns** Returns whether successfully restored or not

**set\_credential\_password** (*access\_id, password*)

Sets the password for an access host

**Parameters**

- **access\_id** (*integer*) – id of the access host
- **password** (*string*) – password to set

### 3.2.2 SoftLayer.cdn

CDN Manager/helpers

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.cdn.CDNManager` (*client*)

Manage CDN accounts and content.

See product information here: <http://www.softlayer.com/content-delivery-network>

**Parameters** **client** (*SoftLayer.API.BaseClient*) – the client instance

**add\_origin** (*account\_id, media\_type, origin\_url, cname=None, secure=False*)

Adds an original pull mapping to an origin-pull.

**Parameters**

- **account\_id** (*int*) – the numeric ID associated with the CDN account.
- **media\_type** (*string*) – the media type/protocol associated with this origin pull mapping; valid values are HTTP, FLASH, and WM.
- **origin\_url** (*string*) – the base URL from which content should be pulled.
- **cname** (*string*) – an optional CNAME that should be associated with this origin pull rule; only the hostname should be included (i.e., no 'http://', directories, etc.).
- **secure** (*boolean*) – specifies whether this is an SSL origin pull rule, if SSL is enabled on your account (defaults to false).

**get\_account** (*account\_id, \*\*kwargs*)

Retrieves a CDN account with the specified account ID.

**Parameters**

- **int** (*account\_id*) – the numeric ID associated with the CDN account.

- **\*\*kwargs** (*dict*) – additional arguments to include in the object mask.

**get\_origins** (*account\_id*, *\*\*kwargs*)

Retrieves list of origin pull mappings for a specified CDN account.

**Parameters**

- **int** (*account\_id*) – the numeric ID associated with the CDN account.
- **\*\*kwargs** (*dict*) – additional arguments to include in the object mask.

**list\_accounts** ()

Lists CDN accounts for the active user.

**load\_content** (*account\_id*, *urls*)

Prefetches one or more URLs to the CDN edge nodes.

**Parameters**

- **account\_id** (*int*) – the CDN account ID into which content should be preloaded.
- **urls** – a string or a list of strings representing the CDN URLs that should be pre-loaded.

**Returns** true if all load requests were successfully submitted; otherwise, returns the first error encountered.

**purge\_content** (*account\_id*, *urls*)

Purges one or more URLs from the CDN edge nodes.

**Parameters**

- **account\_id** (*int*) – the CDN account ID from which content should be purged.
- **urls** – a string or a list of strings representing the CDN URLs that should be purged.

**Returns** a list of SoftLayer\_Container\_Network\_ContentDelivery\_PurgeService\_Response objects which indicates if the purge for each url was SUCCESS, FAILED or INVALID\_URL.

**remove\_origin** (*account\_id*, *origin\_id*)

Removes an origin pull mapping with the given origin pull ID.

**Parameters**

- **account\_id** (*int*) – the CDN account ID from which the mapping should be deleted.
- **origin\_id** (*int*) – the origin pull mapping ID to delete.

**resolve\_ids** (*identifier*)

Takes a string and tries to resolve to a list of matching ids.

What exactly 'identifier' can be depends on the resolvers

**Parameters** **identifier** (*string*) – identifying string

**Returns** list

### 3.2.3 SoftLayer.dedicatedhost

DH Manager/helpers

**license** MIT, see License for more details.

**class** SoftLayer.managers.dedicated\_host.DedicatedHostManager (*client*, *ordering\_manager=None*)

Manages SoftLayer Dedicated Hosts.

See product information here <https://www.ibm.com/cloud/dedicated>

### Parameters

- **client** (*SoftLayer.API.BaseClient*) – the client instance
- **ordering\_manager** (*SoftLayer.managers.OrderingManager*) – an optional manager to handle ordering. If none is provided, one will be auto initialized.

### cancel\_guests (*host\_id*)

Cancel all guests into the dedicated host immediately.

To cancel an specified guest use the method `VSManager.cancel_instance()`

**Parameters** *host\_id* – The ID of the dedicated host.

**Returns** The id, fqdn and status of all guests into a dictionary. The status could be ‘Cancelled’ or an exception message, The dictionary is empty if there isn’t any guest in the dedicated host.

**Example::** # Cancel guests of dedicated host id 12345 result = mgr.cancel\_guests(12345)

### cancel\_host (*host\_id*)

Cancel a dedicated host immediately, it fails if there are still guests in the host.

**Parameters** *host\_id* – The ID of the dedicated host to be cancelled.

**Returns** True on success or an exception

**Example::** # Cancels dedicated host id 12345 result = mgr.cancel\_host(12345)

### get\_create\_options ()

Returns valid options for ordering a dedicated host.

### get\_host (*host\_id*, *\*\*kwargs*)

Get details about a dedicated host.

:param integer : the host ID :returns: A dictionary containing host information.

Example:

```
# Print out host ID 12345.
dh = mgr.get_host(12345)
print dh

# Print out only name and backendRouter for instance 12345
object_mask = "mask[name,backendRouter[id]]"
dh = mgr.get_host(12345, mask=mask)
print dh
```

### get\_router\_options (*datacenter=None*, *flavor=None*)

Returns available backend routers for the dedicated host.

### list\_guests (*host\_id*, *tags=None*, *cpus=None*, *memory=None*, *hostname=None*, *domain=None*, *local\_disk=None*, *nic\_speed=None*, *public\_ip=None*, *private\_ip=None*, *\*\*kwargs*)

Retrieve a list of all virtual servers on the dedicated host.

Example:

```
# Print out a list of instances with 4 cpu cores in the host id 12345.

for vsi in mgr.list_guests(host_id=12345, cpus=4):
    print vsi['fullyQualifiedDomainName'], vsi['primaryIpAddress']

# Using a custom object-mask. Will get ONLY what is specified
object_mask = "mask[hostname,monitoringRobot[robotStatus]]"
for vsi in mgr.list_guests(mask=object_mask, cpus=4):
    print vsi
```

### Parameters

- **host\_id** (*integer*) – the identifier of dedicated host
- **tags** (*list*) – filter based on list of tags
- **cpus** (*integer*) – filter based on number of CPUS
- **memory** (*integer*) – filter based on amount of memory
- **hostname** (*string*) – filter based on hostname
- **domain** (*string*) – filter based on domain
- **local\_disk** (*string*) – filter based on local\_disk
- **nic\_speed** (*integer*) – filter based on network speed (in MBPS)
- **public\_ip** (*string*) – filter based on public ip address
- **private\_ip** (*string*) – filter based on private ip address
- **\*\*kwargs** (*dict*) – response-level options (mask, limit, etc.)

**Returns** Returns a list of dictionaries representing the matching virtual servers

**list\_instances** (*tags=None, cpus=None, memory=None, hostname=None, disk=None, datacenter=None, \*\*kwargs*)

Retrieve a list of all dedicated hosts on the account

### Parameters

- **tags** (*list*) – filter based on list of tags
- **cpus** (*integer*) – filter based on number of CPUS
- **memory** (*integer*) – filter based on amount of memory
- **hostname** (*string*) – filter based on hostname
- **disk** (*string*) – filter based on disk
- **datacenter** (*string*) – filter based on datacenter
- **\*\*kwargs** (*dict*) – response-level options (mask, limit, etc.)

**Returns** Returns a list of dictionaries representing the matching dedicated host.

**place\_order** (*hostname, domain, location, flavor, hourly, router=None*)

Places an order for a dedicated host.

See `get_create_options()` for valid arguments.

### Parameters

- **hostname** (*string*) – server hostname

- **domain** (*string*) – server domain name
- **location** (*string*) – location (datacenter) name
- **hourly** (*boolean*) – True if using hourly pricing (default). False for monthly.
- **router** (*int*) – an optional value for selecting a backend router

**resolve\_ids** (*identifier*)

Takes a string and tries to resolve to a list of matching ids.

What exactly ‘identifier’ can be depends on the resolvers

**Parameters** **identifier** (*string*) – identifying string

**Returns** list

**verify\_order** (*hostname, domain, location, hourly, flavor, router=None*)

Verifies an order for a dedicated host.

See *place\_order()* for a list of available options.

### 3.2.4 SoftLayer.dns

DNS Manager/helpers

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.dns.DNSManager` (*client*)

Manage SoftLayer DNS.

See product information here: <http://www.softlayer.com/DOMAIN-SERVICES>

**Parameters** **client** (*SoftLayer.API.BaseClient*) – the client instance

**create\_record** (*zone\_id, record, record\_type, data, ttl=60*)

Create a resource record on a domain.

**Parameters**

- **id** (*integer*) – the zone’s ID
- **record** – the name of the record to add
- **record\_type** – the type of record (A, AAAA, CNAME, TXT, etc.)
- **data** – the record’s value
- **ttl** (*integer*) – the TTL or time-to-live value (default: 60)

**create\_record\_mx** (*zone\_id, record, data, ttl=60, priority=10*)

Create a mx resource record on a domain.

**Parameters**

- **id** (*integer*) – the zone’s ID
- **record** – the name of the record to add
- **data** – the record’s value
- **ttl** (*integer*) – the TTL or time-to-live value (default: 60)
- **priority** (*integer*) – the priority of the target host

**create\_record\_ptr** (*record, data, ttl=60*)

Create a reverse record.

**Parameters**

- **record** – the public ip address of device for which you would like to manage reverse DNS.
- **data** – the record's value
- **ttl** (*integer*) – the TTL or time-to-live value (default: 60)

**create\_record\_srv** (*zone\_id, record, data, protocol, port, service, ttl=60, priority=20, weight=10*)

Create a resource record on a domain.

**Parameters**

- **id** (*integer*) – the zone's ID
- **record** – the name of the record to add
- **data** – the record's value
- **protocol** (*string*) – the protocol of the service, usually either TCP or UDP.
- **port** (*integer*) – the TCP or UDP port on which the service is to be found.
- **service** (*string*) – the symbolic name of the desired service.
- **ttl** (*integer*) – the TTL or time-to-live value (default: 60)
- **priority** (*integer*) – the priority of the target host (default: 20)
- **weight** (*integer*) – relative weight for records with same priority (default: 10)

**create\_zone** (*zone, serial=None*)

Create a zone for the specified zone.

**Parameters**

- **zone** – the zone name to create
- **serial** – serial value on the zone (default: `strptime(‘%Y%m%d01’)`)

**delete\_record** (*record\_id*)

Delete a resource record by its ID.

**Parameters** **id** (*integer*) – the record's ID

**delete\_zone** (*zone\_id*)

Delete a zone by its ID.

**Parameters** **zone\_id** (*integer*) – the zone ID to delete

**dump\_zone** (*zone\_id*)

Retrieve a zone dump in BIND format.

**Parameters** **id** (*integer*) – The zone ID to dump

**edit\_record** (*record*)

Update an existing record with the options provided.

The provided dict must include an 'id' key and value corresponding to the record that should be updated.

**Parameters** **record** (*dict*) – the record to update

**edit\_zone** (*zone*)

Update an existing zone with the options provided.

The provided dict must include an 'id' key and value corresponding to the zone that should be updated.

**Parameters** **zone** (*dict*) – the zone to update

**get\_record** (*record\_id*)

Get a DNS record.

**Parameters** **id** (*integer*) – the record’s ID

**get\_records** (*zone\_id*, *ttl=None*, *data=None*, *host=None*, *record\_type=None*)

List, and optionally filter, records within a zone.

**Parameters**

- **zone** – the zone name in which to search.
- **ttl** (*int*) – time in seconds
- **data** (*str*) – the records data
- **host** (*str*) – record’s host
- **record\_type** (*str*) – the type of record

**Returns** A list of dictionaries representing the matching records within the specified zone.

**get\_zone** (*zone\_id*, *records=True*)

Get a zone and its records.

**Parameters** **zone** – the zone name

**Returns** A dictionary containing a large amount of information about the specified zone.

**list\_zones** (*\*\*kwargs*)

Retrieve a list of all DNS zones.

**Parameters** **\*\*kwargs** (*dict*) – response-level options (mask, limit, etc.)

**Returns** A list of dictionaries representing the matching zones.

**resolve\_ids** (*identifier*)

Takes a string and tries to resolve to a list of matching ids.

What exactly ‘identifier’ can be depends on the resolvers

**Parameters** **identifier** (*string*) – identifying string

**Returns** list

### 3.2.5 SoftLayer.file

File Storage Manager

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.file.FileStorageManager` (*client*)

Manages file Storage volumes.

**authorize\_host\_to\_volume** (*volume\_id*, *hardware\_ids=None*, *virtual\_guest\_ids=None*,  
*ip\_address\_ids=None*, *subnet\_ids=None*, *\*\*kwargs*)

Authorizes hosts to File Storage Volumes

**Parameters**

- **volume\_id** – The File volume to authorize hosts to
- **hardware\_ids** – A List of SoftLayer\_Hardware ids
- **virtual\_guest\_ids** – A List of SoftLayer\_Virtual\_Guest ids
- **ip\_address\_ids** – A List of SoftLayer\_Network\_Subnet\_IpAddress ids

- **subnet\_ids** – A List of SoftLayer\_Network\_Subnet ids

**Returns** Returns an array of SoftLayer\_Network\_Storage\_Allowed\_Host objects which now have access to the given File volume

**cancel\_file\_volume** (*volume\_id*, *reason='No longer needed'*, *immediate=False*)  
Cancels the given file storage volume.

**Parameters**

- **volume\_id** (*integer*) – The volume ID
- **reason** (*string*) – The reason for cancellation
- **immediate** (*boolean*) – Cancel immediately or on anniversary date

**cancel\_snapshot\_space** (*volume\_id*, *reason='No longer needed'*, *immediate=False*)  
Cancels snapshot space for a given volume.

**Parameters**

- **volume\_id** (*integer*) – The volume ID
- **reason** (*string*) – The reason for cancellation
- **immediate** (*boolean*) – Cancel immediately or on anniversary date

**create\_snapshot** (*volume\_id*, *notes=""*, *\*\*kwargs*)  
Creates a snapshot on the given file volume.

**Parameters**

- **volume\_id** (*integer*) – The id of the volume
- **notes** (*string*) – The notes or “name” to assign the snapshot

**Returns** Returns the id of the new snapshot

**deauthorize\_host\_to\_volume** (*volume\_id*, *hardware\_ids=None*, *virtual\_guest\_ids=None*,  
*ip\_address\_ids=None*, *subnet\_ids=None*, *\*\*kwargs*)  
Revokes authorization of hosts to File Storage Volumes

**Parameters**

- **volume\_id** – The File volume to deauthorize hosts to
- **hardware\_ids** – A List of SoftLayer\_Hardware ids
- **virtual\_guest\_ids** – A List of SoftLayer\_Virtual\_Guest ids
- **ip\_address\_ids** – A List of SoftLayer\_Network\_Subnet\_IpAddress ids
- **subnet\_ids** – A List of SoftLayer\_Network\_Subnet ids

**Returns** Returns an array of SoftLayer\_Network\_Storage\_Allowed\_Host objects which have access to the given File volume

**delete\_snapshot** (*snapshot\_id*)  
Deletes the specified snapshot object.

**Parameters** **snapshot\_id** – The ID of the snapshot object to delete.

**disable\_snapshots** (*volume\_id*, *schedule\_type*)  
Disables snapshots for a specific file volume at a given schedule

**Parameters**

- **volume\_id** (*integer*) – The id of the volume

- **schedule\_type** (*string*) – ‘HOURLY’|‘DAILY’|‘WEEKLY’

**Returns** Returns whether successfully disabled or not

**enable\_snapshots** (*volume\_id, schedule\_type, retention\_count, minute, hour, day\_of\_week, \*\*kwargs*)

Enables snapshots for a specific file volume at a given schedule

#### Parameters

- **volume\_id** (*integer*) – The id of the volume
- **schedule\_type** (*string*) – ‘HOURLY’|‘DAILY’|‘WEEKLY’
- **retention\_count** (*integer*) – The number of snapshots to attempt to retain in this schedule
- **minute** (*integer*) – The minute of the hour at which HOURLY, DAILY, and WEEKLY snapshots should be taken
- **hour** (*integer*) – The hour of the day at which DAILY and WEEKLY snapshots should be taken
- **day\_of\_week** (*string|integer*) – The day of the week on which WEEKLY snapshots should be taken, either as a string (‘SUNDAY’) or integer (‘0’ is Sunday)

**Returns** Returns whether successfully scheduled or not

**failback\_from\_replicant** (*volume\_id, replicant\_id*)

Failback from a volume replicant.

#### Parameters

- **volume\_id** (*integer*) – The ID of the volume
- **replicant\_id** (*integer*) – ID of replicant to failback from

**Returns** Returns whether failback was successful or not

**failover\_to\_replicant** (*volume\_id, replicant\_id, immediate=False*)

Failover to a volume replicant.

#### Parameters

- **volume\_id** (*integer*) – The ID of the volume
- **replicant\_id** (*integer*) – ID of replicant to failover to
- **immediate** (*boolean*) – Flag indicating if failover is immediate

**Returns** Returns whether failover was successful or not

**get\_file\_volume\_access\_list** (*volume\_id, \*\*kwargs*)

Returns a list of authorized hosts for a specified volume.

#### Parameters

- **volume\_id** – ID of volume.
- **kwargs** –

**Returns** Returns a list of authorized hosts for a specified volume.

**get\_file\_volume\_details** (*volume\_id, \*\*kwargs*)

Returns details about the specified volume.

#### Parameters

- **volume\_id** – ID of volume.

- **kwargs** –

**Returns** Returns details about the specified volume.

**get\_file\_volume\_snapshot\_list** (*volume\_id*, *\*\*kwargs*)

Returns a list of snapshots for the specified volume.

**Parameters**

- **volume\_id** – ID of volume.
- **kwargs** –

**Returns** Returns a list of snapshots for the specified volume.

**get\_replication\_locations** (*volume\_id*)

Acquires list of the datacenters to which a volume can be replicated.

**Parameters** **volume\_id** – The ID of the primary volume to be replicated

**Returns** Returns an array of SoftLayer\_Network\_Storage objects

**get\_replication\_partners** (*volume\_id*)

Acquires list of replicant volumes pertaining to the given volume.

**Parameters** **volume\_id** – The ID of the primary volume to be replicated

**Returns** Returns an array of SoftLayer\_Location objects

**list\_file\_volumes** (*datacenter=None*, *username=None*, *storage\_type=None*, *\*\*kwargs*)

Returns a list of file volumes.

**Parameters**

- **datacenter** – Datacenter short name (e.g.: dal09)
- **username** – Name of volume.
- **storage\_type** – Type of volume: Endurance or Performance
- **kwargs** –

**Returns** Returns a list of file volumes.

**list\_volume\_schedules** (*volume\_id*)

Lists schedules for a given volume

**Parameters** **volume\_id** (*integer*) – The id of the volume

**Returns** Returns list of schedules assigned to a given volume

**order\_duplicate\_volume** (*origin\_volume\_id*, *origin\_snapshot\_id=None*, *duplicate\_size=None*,  
*duplicate\_iops=None*, *duplicate\_tier\_level=None*, *duplicate\_snapshot\_size=None*, *hourly\_billing\_flag=False*)

Places an order for a duplicate file volume.

**Parameters**

- **origin\_volume\_id** – The ID of the origin volume to be duplicated
- **origin\_snapshot\_id** – Origin snapshot ID to use for duplication
- **duplicate\_size** – Size/capacity for the duplicate volume
- **duplicate\_iops** – The IOPS per GB for the duplicate volume
- **duplicate\_tier\_level** – Tier level for the duplicate volume
- **duplicate\_snapshot\_size** – Snapshot space size for the duplicate

- **hourly\_billing\_flag** – Billing type, monthly (False) or hourly (True), default to monthly.

**Returns** Returns a SoftLayer\_Container\_Product\_Order\_Receipt

**order\_file\_volume** (*storage\_type, location, size, iops=None, tier\_level=None, snapshot\_size=None, service\_offering='storage\_as\_a\_service', hourly\_billing\_flag=False*)

Places an order for a file volume.

#### Parameters

- **storage\_type** – ‘performance’ or ‘endurance’
- **location** – Name of the datacenter in which to order the volume
- **size** – Size of the desired volume, in GB
- **iops** – Number of IOPs for a “Performance” order
- **tier\_level** – Tier level to use for an “Endurance” order
- **snapshot\_size** – The size of optional snapshot space, if snapshot space should also be ordered (None if not ordered)
- **service\_offering** – Requested offering package to use in the order (‘storage\_as\_a\_service’, ‘enterprise’, or ‘performance’)
- **hourly\_billing\_flag** – Billing type, monthly (False) or hourly (True), default to monthly.

**order\_modified\_volume** (*volume\_id, new\_size=None, new\_iops=None, new\_tier\_level=None*)

Places an order for modifying an existing file volume.

#### Parameters

- **volume\_id** – The ID of the volume to be modified
- **new\_size** – The new size/capacity for the volume
- **new\_iops** – The new IOPS for the volume
- **new\_tier\_level** – The new tier level for the volume

**Returns** Returns a SoftLayer\_Container\_Product\_Order\_Receipt

**order\_replicant\_volume** (*volume\_id, snapshot\_schedule, location, tier=None*)

Places an order for a replicant file volume.

#### Parameters

- **volume\_id** – The ID of the primary volume to be replicated
- **snapshot\_schedule** – The primary volume’s snapshot schedule to use for replication
- **location** – The location for the ordered replicant volume
- **tier** – The tier (IOPS per GB) of the primary volume

**Returns** Returns a SoftLayer\_Container\_Product\_Order\_Receipt

**order\_snapshot\_space** (*volume\_id, capacity, tier, upgrade, \*\*kwargs*)

Orders snapshot space for the given file volume.

#### Parameters

- **volume\_id** (*integer*) – The ID of the volume
- **capacity** (*integer*) – The capacity to order, in GB

- **tier** (*float*) – The tier level of the file volume, in IOPS per GB
- **upgrade** (*boolean*) – Flag to indicate if this order is an upgrade

**Returns** Returns a SoftLayer\_Container\_Product\_Order\_Receipt

**resolve\_ids** (*identifier*)

Takes a string and tries to resolve to a list of matching ids.

What exactly ‘identifier’ can be depends on the resolvers

**Parameters** **identifier** (*string*) – identifying string

**Returns** list

**restore\_from\_snapshot** (*volume\_id, snapshot\_id*)

Restores a specific volume from a snapshot

**Parameters**

- **volume\_id** (*integer*) – The ID of the volume
- **snapshot\_id** (*integer*) – The id of the restore point

**Returns** Returns whether successfully restored or not

### 3.2.6 SoftLayer.firewall

Firewall Manager/helpers

**license** MIT, see LICENSE for more details.

**class** SoftLayer.managers.firewall.**FirewallManager** (*client*)

Manages SoftLayer firewalls

See product information here: <http://www.softlayer.com/firewalls>

**Parameters** **client** (*SoftLayer.API.BaseClient*) – the client instance

**add\_standard\_firewall** (*server\_id, is\_virt=True*)

Creates a firewall for the specified virtual/hardware server.

**Parameters**

- **server\_id** (*int*) – The ID of the server to create the firewall for
- **is\_virt** (*bool*) – If true, will create the firewall for a virtual server, otherwise for a hardware server.

**Returns** A dictionary containing the standard virtual server firewall order

**add\_vlan\_firewall** (*vlan\_id, ha\_enabled=False*)

Creates a firewall for the specified vlan.

**Parameters**

- **vlan\_id** (*int*) – The ID of the vlan to create the firewall for
- **ha\_enabled** (*bool*) – If True, an HA firewall will be created

**Returns** A dictionary containing the VLAN firewall order

**cancel\_firewall** (*firewall\_id, dedicated=False*)

Cancels the specified firewall.

**Parameters**

- **firewall\_id** (*int*) – Firewall ID to be cancelled.
- **dedicated** (*bool*) – If true, the firewall instance is dedicated, otherwise, the firewall instance is shared.

**edit\_dedicated\_fw\_rules** (*firewall\_id, rules*)

Edit the rules for dedicated firewall.

**Parameters**

- **firewall\_id** (*integer*) – the instance ID of the dedicated firewall
- **rules** (*list*) – the rules to be pushed on the firewall as defined by SoftLayer\_Network\_Firewall\_Update\_Request\_Rule

**edit\_standard\_fw\_rules** (*firewall\_id, rules*)

Edit the rules for standard firewall.

**Parameters**

- **firewall\_id** (*integer*) – the instance ID of the standard firewall
- **rules** (*dict*) – the rules to be pushed on the firewall

**get\_dedicated\_fw\_rules** (*firewall\_id*)

Get the rules of a dedicated firewall.

**Parameters** **firewall\_id** (*integer*) – the instance ID of the dedicated firewall

**Returns** A list of the rules.

**get\_dedicated\_package** (*ha\_enabled=False*)

Retrieves the dedicated firewall package.

**Parameters** **ha\_enabled** (*bool*) – True if HA is to be enabled on the firewall False for No HA

**Returns** A dictionary containing the dedicated virtual server firewall package

**get\_firewalls** ()

Returns a list of all firewalls on the account.

**Returns** A list of firewalls on the current account.

**get\_standard\_fw\_rules** (*firewall\_id*)

Get the rules of a standard firewall.

**Parameters** **firewall\_id** (*integer*) – the instance ID of the standard firewall

**Returns** A list of the rules.

**get\_standard\_package** (*server\_id, is\_virt=True*)

Retrieves the standard firewall package for the virtual server.

**Parameters**

- **server\_id** (*int*) – The ID of the server to create the firewall for
- **is\_virt** (*bool*) – True if the ID provided is for a virtual server, False for a server

**Returns** A dictionary containing the standard virtual server firewall package

**resolve\_ids** (*identifier*)

Takes a string and tries to resolve to a list of matching ids.

What exactly ‘identifier’ can be depends on the resolvers

**Parameters** **identifier** (*string*) – identifying string

**Returns list**

`SoftLayer.managers.firewall.has_firewall(vlan)`  
Helper to determine whether or not a VLAN has a firewall.

**Parameters** `vlan` (*dict*) – A dictionary representing a VLAN

**Returns** True if the VLAN has a firewall, false if it doesn't.

### 3.2.7 SoftLayer.hardware

Hardware Manager/helpers

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.hardware.HardwareManager` (*client, ordering\_manager=None*)  
Manage SoftLayer hardware servers.

Example:

```
# Initialize the Manager.
# env variables. These can also be specified in ~/.softlayer,
# or passed directly to SoftLayer.Client()
# SL_USERNAME = YOUR_USERNAME
# SL_API_KEY = YOUR_API_KEY
import SoftLayer
client = SoftLayer.Client()
mgr = SoftLayer.HardwareManager(client)
```

See product information here: <http://www.softlayer.com/bare-metal-servers>

**Parameters**

- **client** (*SoftLayer.API.BaseClient*) – the client instance
- **ordering\_manager** (*SoftLayer.managers.OrderingManager*) – an optional manager to handle ordering. If none is provided, one will be auto initialized.

**cancel\_hardware** (*hardware\_id, reason='unneeded', comment='', immediate=False*)  
Cancels the specified dedicated server.

Example:

```
# Cancels hardware id 1234
result = mgr.cancel_hardware(hardware_id=1234)
```

**Parameters**

- **hardware\_id** (*int*) – The ID of the hardware to be cancelled.
- **reason** (*string*) – The reason code for the cancellation. This should come from `get_cancellation_reasons()`.
- **comment** (*string*) – An optional comment to include with the cancellation.
- **immediate** (*bool*) – If set to True, will automatically update the cancelation ticket to request the resource be reclaimed asap. This request still has to be reviewed by a human

**Returns** True on success or an exception

**change\_port\_speed** (*hardware\_id, public, speed*)  
Allows you to change the port speed of a server's NICs.

**Parameters**

- **hardware\_id** (*int*) – The ID of the server
- **public** (*bool*) – Flag to indicate which interface to change. True (default) means the public interface. False indicates the private interface.
- **speed** (*int*) – The port speed to set.

**Warning:** A port speed of 0 will disable the interface.

Example:

```
#change the Public interface to 10Mbps on instance 12345
result = mgr.change_port_speed(hardware_id=12345,
                               public=True, speed=10)
# result will be True or an Exception
```

**edit** (*hardware\_id*, *userdata=None*, *hostname=None*, *domain=None*, *notes=None*, *tags=None*)  
 Edit hostname, domain name, notes, user data of the hardware.

Parameters set to None will be ignored and not attempted to be updated.

**Parameters**

- **hardware\_id** (*integer*) – the instance ID to edit
- **userdata** (*string*) – user data on the hardware to edit. If none exist it will be created
- **hostname** (*string*) – valid hostname
- **domain** (*string*) – valid domain name
- **notes** (*string*) – notes about this particular hardware
- **tags** (*string*) – tags to set on the hardware as a comma separated list. Use the empty string to remove all tags.

Example:

```
# Change the hostname on instance 12345 to 'something'
result = mgr.edit(hardware_id=12345 , hostname="something")
#result will be True or an Exception
```

**get\_cancellation\_reasons** ()

Returns a dictionary of valid cancellation reasons.

These can be used when cancelling a dedicated server via *cancel\_hardware* ().

**get\_create\_options** (\*\**kwargs*)

Returns valid options for ordering hardware.

**get\_hardware** (\*\**kwargs*)

Get details about a hardware device.

**Parameters** **id** (*integer*) – the hardware ID

**Returns** A dictionary containing a large amount of information about the specified server.

Example:

```
object_mask = "mask[id,networkVlans[vlanNumber]]"  
# Object masks are optional  
result = mgr.get_hardware(hardware_id=1234,mask=object_mask)
```

**list\_hardware** (\*\*kwargs)

List all hardware (servers and bare metal computing instances).

**param list tags** filter based on tags

**param integer cpus** filter based on number of CPUS

**param integer memory** filter based on amount of memory in gigabytes

**param string hostname** filter based on hostname

**param string domain** filter based on domain

**param string datacenter** filter based on datacenter

**param integer nic\_speed** filter based on network speed (in MBPS)

**param string public\_ip** filter based on public ip address

**param string private\_ip** filter based on private ip address

**param dict \*\*kwargs** response-level options (mask, limit, etc.)

**returns** Returns a list of dictionaries representing the matching hardware. This list will contain both dedicated servers and bare metal computing instances

Example:

```
# Using a custom object-mask. Will get ONLY what is specified  
# These will stem from the SoftLayer_Hardware_Server datatype  
object_mask = "mask[hostname,monitoringRobot[robotStatus]]"  
result = mgr.list_hardware(mask=object_mask)
```

**place\_order** (\*\*kwargs)

Places an order for a piece of hardware.

See `get_create_options()` for valid arguments.

**Parameters**

- **size** (*string*) – server size name or presetId
- **hostname** (*string*) – server hostname
- **domain** (*string*) – server domain name
- **location** (*string*) – location (datacenter) name
- **os** (*string*) – operating system name
- **port\_speed** (*int*) – Port speed in Mbps
- **ssh\_keys** (*list*) – list of ssh key ids
- **post\_uri** (*string*) – The URI of the post-install script to run after reload
- **hourly** (*boolean*) – True if using hourly pricing (default). False for monthly.
- **no\_public** (*boolean*) – True if this server should only have private interfaces
- **extras** (*list*) – List of extra feature names

**reload** (*hardware\_id*, *post\_uri=None*, *ssh\_keys=None*)

Perform an OS reload of a server with its current configuration.

**Parameters**

- **hardware\_id** (*integer*) – the instance ID to reload
- **post\_uri** (*string*) – The URI of the post-install script to run after reload
- **ssh\_keys** (*list*) – The SSH keys to add to the root user

**rescue** (*hardware\_id*)

Reboot a server into the a rescue kernel.

**Parameters** **instance\_id** (*integer*) – the server ID to rescue

Example:

```
result = mgr.rescue(1234)
```

**resolve\_ids** (*identifier*)

Takes a string and tries to resolve to a list of matching ids.

What exactly 'identifier' can be depends on the resolvers

**Parameters** **identifier** (*string*) – identifying string

**Returns** list

**update\_firmware** (*hardware\_id*, *ipmi=True*, *raid\_controller=True*, *bios=True*, *hard\_drive=True*)

Update hardware firmware.

This will cause the server to be unavailable for ~20 minutes.

**Parameters**

- **hardware\_id** (*int*) – The ID of the hardware to have its firmware updated.
- **ipmi** (*bool*) – Update the ipmi firmware.
- **raid\_controller** (*bool*) – Update the raid controller firmware.
- **bios** (*bool*) – Update the bios firmware.
- **hard\_drive** (*bool*) – Update the hard drive firmware.

Example:

```
# Check the servers active transactions to see progress
result = mgr.update_firmware(hardware_id=1234)
```

**verify\_order** (*\*\*kwargs*)

Verifies an order for a piece of hardware.

See `place_order()` for a list of available options.

**wait\_for\_ready** (*instance\_id*, *limit=14400*, *delay=10*, *pending=False*)

Determine if a Server is ready.

A server is ready when no transactions are running on it.

**Parameters**

- **instance\_id** (*int*) – The instance ID with the pending transaction
- **limit** (*int*) – The maximum amount of seconds to wait.
- **delay** (*int*) – The number of seconds to sleep before checks. Defaults to 10.

### 3.2.8 SoftLayer.image

Image Manager/helpers

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.image.ImageManager` (*client*)

Manages SoftLayer server images.

See product information here: [https://console.ibm.com/docs/infrastructure/image-templates/image\\_index.html](https://console.ibm.com/docs/infrastructure/image-templates/image_index.html)

**Parameters** `client` (*SoftLayer.API.BaseClient*) – the client instance

**delete\_image** (*image\_id*)

Deletes the specified image.

**Parameters** `image_id` (*int*) – The ID of the image.

**edit** (*image\_id*, *name=None*, *note=None*, *tag=None*)

Edit image related details.

**Parameters**

- `image_id` (*int*) – The ID of the image
- `name` (*string*) – Name of the Image.
- `note` (*string*) – Note of the image.
- `tag` (*string*) – Tags of the image to be updated to.

**export\_image\_to\_uri** (*image\_id*, *uri*, *ibm\_api\_key=None*)

Export image into the given object storage

**Parameters**

- `image_id` (*int*) – The ID of the image
- `uri` (*string*) – The URI for object storage of the format `swift://<objectStorageAccount>@<cluster>/<container>/<objectPath>` or `cos://<regionName>/<bucketName>/<objectPath>` if using IBM Cloud Object Storage
- `ibm_api_key` (*string*) – Ibm Api Key needed to communicate with IBM Cloud Object Storage

**get\_image** (*image\_id*, *\*\*kwargs*)

Get details about an image.

**Parameters**

- `image` (*int*) – The ID of the image.
- `**kwargs` (*dict*) – response-level options (mask, limit, etc.)

**import\_image\_from\_uri** (*name*, *uri*, *os\_code=None*, *note=None*, *ibm\_api\_key=None*, *root\_key\_id=None*, *wrapped\_dek=None*, *kp\_id=None*, *cloud\_init=False*, *byol=False*, *is\_encrypted=False*)

Import a new image from object storage.

**Parameters**

- `name` (*string*) – Name of the new image

- **uri** (*string*) – The URI for an object storage object (.vhd/iso file) of the format: swift://<objectStorageAccount>@<cluster>/<container>/<objectPath> or (.vhd/iso/raw file) of the format: cos://<regionName>/<bucketName>/<objectPath> if using IBM Cloud Object Storage
- **os\_code** (*string*) – The reference code of the operating system
- **note** (*string*) – Note to add to the image
- **ibm\_api\_key** (*string*) – Ibm Api Key needed to communicate with ICOS and Key Protect
- **root\_key\_id** (*string*) – ID of the root key in Key Protect
- **wrapped\_dek** (*string*) – Wrapped Data Encryption Key provided by IBM KeyProtect
- **kp\_id** (*string*) – ID of the IBM Key Protect Instance
- **cloud\_init** (*boolean*) – Specifies if image is cloud-init
- **byol** (*boolean*) – Specifies if image is bring your own license
- **is\_encrypted** (*boolean*) – Specifies if image is encrypted

**list\_private\_images** (*guid=None, name=None, \*\*kwargs*)

List all private images.

#### Parameters

- **guid** (*string*) – filter based on GUID
- **name** (*string*) – filter based on name
- **\*\*kwargs** (*dict*) – response-level options (mask, limit, etc.)

**list\_public\_images** (*guid=None, name=None, \*\*kwargs*)

List all public images.

#### Parameters

- **guid** (*string*) – filter based on GUID
- **name** (*string*) – filter based on name
- **\*\*kwargs** (*dict*) – response-level options (mask, limit, etc.)

**resolve\_ids** (*identifier*)

Takes a string and tries to resolve to a list of matching ids.

What exactly ‘identifier’ can be depends on the resolvers

**Parameters** **identifier** (*string*) – identifying string

**Returns** list

## 3.2.9 SoftLayer.ipsec

IPSec VPN Manager

**license** MIT, see LICENSE for more details.

**class** SoftLayer.managers.ipsec.**IPSECManager** (*client*)

Manage SoftLayer IPSEC VPN tunnel contexts.

This provides helpers to manage IPSEC contexts, private and remote subnets, and NAT translations.

**Parameters**

- **client** (*SoftLayer.API.BaseClient*) – the client instance
- **account** (*SoftLayer.API.BaseClient*) – account service client
- **context** (*SoftLayer.API.BaseClient*) – tunnel context client
- **customer\_subnet** (*SoftLayer.API.BaseClient*) – remote subnet client

**add\_internal\_subnet** (*context\_id, subnet\_id*)

Add an internal subnet to a tunnel context.

**Parameters**

- **context\_id** (*int*) – The id-value representing the context instance.
- **subnet\_id** (*int*) – The id-value representing the internal subnet.

**Return bool** True if internal subnet addition was successful.

**add\_remote\_subnet** (*context\_id, subnet\_id*)

Adds a remote subnet to a tunnel context.

**Parameters**

- **context\_id** (*int*) – The id-value representing the context instance.
- **subnet\_id** (*int*) – The id-value representing the remote subnet.

**Return bool** True if remote subnet addition was successful.

**add\_service\_subnet** (*context\_id, subnet\_id*)

Adds a service subnet to a tunnel context.

**Parameters**

- **context\_id** (*int*) – The id-value representing the context instance.
- **subnet\_id** (*int*) – The id-value representing the service subnet.

**Return bool** True if service subnet addition was successful.

**apply\_configuration** (*context\_id*)

Requests network configuration for a tunnel context.

**Parameters** **context\_id** (*int*) – The id-value representing the context instance.

**Return bool** True if the configuration request was successfully queued.

**create\_remote\_subnet** (*account\_id, identifier, cidr*)

Creates a remote subnet on the given account.

**Parameters**

- **account\_id** (*string*) – The account identifier.
- **identifier** (*string*) – The network identifier of the remote subnet.
- **cidr** (*string*) – The CIDR value of the remote subnet.

**Return dict** Mapping of properties for the new remote subnet.

**create\_translation** (*context\_id, static\_ip, remote\_ip, notes*)

Creates an address translation on a tunnel context/

**Parameters**

- **context\_id** (*int*) – The id-value representing the context instance.

- **static\_ip** (*string*) – The IP address value representing the internal side of the translation entry,
- **remote\_ip** (*string*) – The IP address value representing the remote side of the translation entry,
- **notes** (*string*) – The notes to supply with the translation entry,

**Return dict** Mapping of properties for the new translation entry.

**delete\_remote\_subnet** (*subnet\_id*)

Deletes a remote subnet from the current account.

**Parameters** **subnet\_id** (*string*) – The id-value representing the remote subnet.

**Return bool** True if subnet deletion was successful.

**get\_translation** (*context\_id, translation\_id*)

Retrieves a translation entry for the given id values.

**Parameters**

- **context\_id** (*int*) – The id-value representing the context instance.
- **translation\_id** (*int*) – The id-value representing the translation instance.

**Return dict** Mapping of properties for the translation entry.

**Raises** *SoftLayerAPIError* – If a translation cannot be found.

**get\_translations** (*context\_id*)

Retrieves all translation entries for a tunnel context.

**Parameters** **context\_id** (*int*) – The id-value representing the context instance.

**Return list(dict)** Translations associated with the given context

**get\_tunnel\_context** (*context\_id, \*\*kwargs*)

Retrieves the network tunnel context instance.

**Parameters** **context\_id** (*int*) – The id-value representing the context instance.

**Return dict** Mapping of properties for the tunnel context.

**Raises** *SoftLayerAPIError* – If a context cannot be found.

**get\_tunnel\_contexts** (*\*\*kwargs*)

Retrieves network tunnel module context instances.

**Return list(dict)** Contexts associated with the current account.

**remove\_internal\_subnet** (*context\_id, subnet\_id*)

Remove an internal subnet from a tunnel context.

**Parameters**

- **context\_id** (*int*) – The id-value representing the context instance.
- **subnet\_id** (*int*) – The id-value representing the internal subnet.

**Return bool** True if internal subnet removal was successful.

**remove\_remote\_subnet** (*context\_id, subnet\_id*)

Removes a remote subnet from a tunnel context.

**Parameters**

- **context\_id** (*int*) – The id-value representing the context instance.

- **subnet\_id** (*int*) – The id-value representing the remote subnet.

**Return bool** True if remote subnet removal was successful.

**remove\_service\_subnet** (*context\_id, subnet\_id*)

Removes a service subnet from a tunnel context.

**Parameters**

- **context\_id** (*int*) – The id-value representing the context instance.
- **subnet\_id** (*int*) – The id-value representing the service subnet.

**Return bool** True if service subnet removal was successful.

**remove\_translation** (*context\_id, translation\_id*)

Removes a translation entry from a tunnel context.

**Parameters**

- **context\_id** (*int*) – The id-value representing the context instance.
- **translation\_id** (*int*) – The id-value representing the translation.

**Return bool** True if translation entry removal was successful.

**resolve\_ids** (*identifier*)

Takes a string and tries to resolve to a list of matching ids.

What exactly 'identifier' can be depends on the resolvers

**Parameters** **identifier** (*string*) – identifying string

**Returns list**

**update\_translation** (*context\_id, translation\_id, static\_ip=None, remote\_ip=None, notes=None*)

Updates an address translation entry using the given values.

**Parameters**

- **context\_id** (*int*) – The id-value representing the context instance.
- **template** (*dict*) – A key-value mapping of translation properties.
- **static\_ip** (*string*) – The static IP address value to update.
- **remote\_ip** (*string*) – The remote IP address value to update.
- **notes** (*string*) – The notes value to update.

**Return bool** True if the update was successful.

**update\_tunnel\_context** (*context\_id, friendly\_name=None, remote\_peer=None, preshared\_key=None, phase1\_auth=None, phase1\_crypto=None, phase1\_dh=None, phase1\_key\_ttl=None, phase2\_auth=None, phase2\_crypto=None, phase2\_dh=None, phase2\_forward\_secrecy=None, phase2\_key\_ttl=None*)

Updates a tunnel context using the given values.

**Parameters**

- **context\_id** (*string*) – The id-value representing the context.
- **friendly\_name** (*string*) – The friendly name value to update.
- **remote\_peer** (*string*) – The remote peer IP address value to update.
- **preshared\_key** (*string*) – The preshared key value to update.

- **phase1\_auth** (*string*) – The phase 1 authentication value to update.
- **phase1\_crypto** (*string*) – The phase 1 encryption value to update.
- **phase1\_dh** (*string*) – The phase 1 diffie hellman group value to update.
- **phase1\_key\_ttl** (*string*) – The phase 1 key life value to update.
- **phase2\_auth** (*string*) – The phase 2 authentication value to update.
- **phase2\_crypto** (*string*) – The phase 2 encryption value to update.
- **phase2\_df** (*string*) – The phase 2 diffie hellman group value to update.
- **phase2\_forward\_secrecy** (*string*) – The phase 2 perfect forward secrecy value to update.
- **phase2\_key\_ttl** (*string*) – The phase 2 key life value to update.

**Return bool** True if the update was successful.

### 3.2.10 SoftLayer.load\_balancer

Load Balancer Manager/helpers

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.load_balancer.LoadBalancerManager` (*client*)  
Manages SoftLayer load balancers.

See product information here: <http://www.softlayer.com/load-balancing>

**Parameters** **client** (*SoftLayer.API.BaseClient*) – the client instance

**add\_local\_lb** (*price\_item\_id, datacenter*)

Creates a local load balancer in the specified data center.

#### Parameters

- **price\_item\_id** (*int*) – The price item ID for the load balancer
- **datacenter** (*string*) – The datacenter to create the loadbalancer in

**Returns** A dictionary containing the product order

**add\_service** (*loadbal\_id, service\_group\_id, ip\_address\_id, port=80, enabled=True, hc\_type=21, weight=1*)

Adds a new service to the service group.

#### Parameters

- **loadbal\_id** (*int*) – The id of the loadbal where the service resides
- **service\_group\_id** (*int*) – The group to add the service to
- **ip\_address id** (*int*) – The ip address ID of the service
- **port** (*int*) – the port of the service
- **enabled** (*bool*) – Enable or disable the service
- **hc\_type** (*int*) – The health check type
- **weight** (*int*) – the weight to give to the service

**add\_service\_group** (*lb\_id, allocation=100, port=80, routing\_type=2, routing\_method=10*)

Adds a new service group to the load balancer.

**Parameters**

- **loadbal\_id** (*int*) – The id of the loadbal where the service resides
- **allocation** (*int*) – percent of connections to allocate toward the group
- **port** (*int*) – the port of the service group
- **routing\_type** (*int*) – the routing type to set on the service group
- **routing\_method** (*int*) – The routing method to set on the group

**cancel\_lb** (*loadbal\_id*)

Cancels the specified load balancer.

**Parameters** **loadbal\_id** (*int*) – Load Balancer ID to be cancelled.**delete\_service** (*service\_id*)

Deletes a service from the loadbal\_id.

**Parameters** **service\_id** (*int*) – The id of the service to delete**delete\_service\_group** (*group\_id*)

Deletes a service group from the loadbal\_id.

**Parameters** **group\_id** (*int*) – The id of the service group to delete**edit\_service** (*loadbal\_id*, *service\_id*, *ip\_address\_id=None*, *port=None*, *enabled=None*,  
*hc\_type=None*, *weight=None*)

Edits an existing service properties.

**Parameters**

- **loadbal\_id** (*int*) – The id of the loadbal where the service resides
- **service\_id** (*int*) – The id of the service to edit
- **ip\_address** (*string*) – The ip address of the service
- **port** (*int*) – the port of the service
- **enabled** (*bool*) – enable or disable the search
- **hc\_type** (*int*) – The health check type
- **weight** (*int*) – the weight to give to the service

**edit\_service\_group** (*loadbal\_id*, *group\_id*, *allocation=None*, *port=None*, *routing\_type=None*,  
*routing\_method=None*)

Edit an existing service group.

**Parameters**

- **loadbal\_id** (*int*) – The id of the loadbal where the service resides
- **group\_id** (*int*) – The id of the service group
- **allocation** (*int*) – the % of connections to allocate to the group
- **port** (*int*) – the port of the service group
- **routing\_type** (*int*) – the routing type to set on the service group
- **routing\_method** (*int*) – The routing method to set on the group

**get\_hc\_types** ()

Retrieves the health check type values.

**Returns** A dictionary containing the health check types

**get\_lb\_pkgs** ()

Retrieves the local load balancer packages.

**Returns** A dictionary containing the load balancer packages

**get\_local\_lb** (*loadbal\_id*, *\*\*kwargs*)

Returns a specified local load balancer given the id.

**Parameters** **loadbal\_id** (*int*) – The id of the load balancer to retrieve

**Returns** A dictionary containing the details of the load balancer

**get\_local\_lbs** ()

Returns a list of all local load balancers on the account.

**Returns** A list of all local load balancers on the current account.

**get\_routing\_methods** ()

Retrieves the load balancer routing methods.

**Returns** A dictionary containing the load balancer routing methods

**get\_routing\_types** ()

Retrieves the load balancer routing types.

**Returns** A dictionary containing the load balancer routing types

**reset\_service\_group** (*loadbal\_id*, *group\_id*)

Resets all the connections on the service group.

**Parameters**

- **loadbal\_id** (*int*) – The id of the loadbal
- **group\_id** (*int*) – The id of the service group to reset

**resolve\_ids** (*identifier*)

Takes a string and tries to resolve to a list of matching ids.

What exactly ‘identifier’ can be depends on the resolvers

**Parameters** **identifier** (*string*) – identifying string

**Returns** list

**toggle\_service\_status** (*service\_id*)

Toggles the service status.

**Parameters** **service\_id** (*int*) – The id of the service to delete

### 3.2.11 SoftLayer.messaging

Manager for the SoftLayer Message Queue service

**license** MIT, see LICENSE for more details.

**class** SoftLayer.managers.messaging.**MessagingConnection** (*account\_id*, *point=None*) *end-*

Message Queue Service Connection.

**Parameters**

- **account\_id** – Message Queue Account id
- **endpoint** – Endpoint URL

**authenticate** (*username, api\_key, auth\_token=None*)  
Authenticate this connection using the given credentials.

**Parameters**

- **username** – SoftLayer username
- **api\_key** – SoftLayer API Key
- **auth\_token** – (optional) Starting auth token

**create\_queue** (*queue\_name, \*\*kwargs*)  
Create Queue.

**Parameters**

- **queue\_name** – Queue Name
- **\*\*kwargs** (*dict*) – queue options

**create\_subscription** (*topic\_name, subscription\_type, \*\*kwargs*)  
Create Subscription.

**Parameters**

- **topic\_name** – Topic Name
- **subscription\_type** – type ('queue' or 'http')
- **\*\*kwargs** (*dict*) – Subscription options

**create\_topic** (*topic\_name, \*\*kwargs*)  
Create Topic.

**Parameters**

- **topic\_name** – Topic Name
- **\*\*kwargs** (*dict*) – Topic options

**delete\_message** (*queue\_name, message\_id*)  
Delete a message.

**Parameters**

- **queue\_name** – Queue Name
- **message\_id** – Message id

**delete\_queue** (*queue\_name, force=False*)  
Delete Queue.

**Parameters**

- **queue\_name** – Queue Name
- **force** – (optional) Force queue to be deleted even if there are pending messages

**delete\_subscription** (*topic\_name, subscription\_id*)  
Delete a subscription.

**Parameters**

- **topic\_name** – Topic Name
- **subscription\_id** – Subscription id

**delete\_topic** (*topic\_name, force=False*)  
Delete Topic.

**Parameters**

- **topic\_name** – Topic Name
- **force** – (optional) Force topic to be deleted even if there are attached subscribers

**get\_queue** (*queue\_name*)

Get queue details.

**Parameters** **queue\_name** – Queue Name**get\_queues** (*tags=None*)

Get listing of queues.

**Parameters** **tags** (*list*) – (optional) list of tags to filter by**get\_subscriptions** (*topic\_name*)

Listing of subscriptions on a topic.

**Parameters** **topic\_name** – Topic Name**get\_topic** (*topic\_name*)

Get topic details.

**Parameters** **topic\_name** – Topic Name**get\_topics** (*tags=None*)

Get listing of topics.

**Parameters** **tags** (*list*) – (optional) list of tags to filter by**modify\_queue** (*queue\_name, \*\*kwargs*)

Modify Queue.

**Parameters**

- **queue\_name** – Queue Name
- **\*\*kwargs** (*dict*) – queue options

**modify\_topic** (*topic\_name, \*\*kwargs*)

Modify Topic.

**Parameters**

- **topic\_name** – Topic Name
- **\*\*kwargs** (*dict*) – Topic options

**pop\_message** (*queue\_name*)

Pop a single message from a queue.

If no messages are returned this returns None

**Parameters** **queue\_name** – Queue Name**pop\_messages** (*queue\_name, count=1*)

Pop messages from a queue.

**Parameters**

- **queue\_name** – Queue Name
- **count** – (optional) number of messages to retrieve

**push\_queue\_message** (*queue\_name, body, \*\*kwargs*)

Create Queue Message.

**Parameters**

- **queue\_name** – Queue Name
- **body** – Message body
- **\*\*kwargs** (*dict*) – Message options

**push\_topic\_message** (*topic\_name, body, \*\*kwargs*)  
Create Topic Message.

**Parameters**

- **topic\_name** – Topic Name
- **body** – Message body
- **\*\*kwargs** (*dict*) – Topic message options

**stats** (*period='hour'*)  
Get account stats.

**Parameters** **period** – ‘hour’, ‘day’, ‘week’, ‘month’

**class** SoftLayer.managers.messaging.**MessagingManager** (*client*)  
Manage SoftLayer Message Queue accounts.

See product information here: <http://www.softlayer.com/message-queue>

**Parameters** **client** (*SoftLayer.API.BaseClient*) – the client instance

**get\_connection** (*account\_id, datacenter=None, network=None*)  
Get connection to Message Queue Service.

**Parameters**

- **account\_id** – Message Queue Account id
- **datacenter** – Datacenter code
- **network** – network (‘public’ or ‘private’)

**get\_endpoint** (*datacenter=None, network=None*)  
Get a message queue endpoint based on datacenter/network type.

**Parameters**

- **datacenter** – datacenter code
- **network** – network (‘public’ or ‘private’)

**get\_endpoints** ()  
Get all known message queue endpoints.

**list\_accounts** (*\*\*kwargs*)  
List message queue accounts.

**Parameters** **\*\*kwargs** (*dict*) – response-level options (mask, limit, etc.)

**ping** (*datacenter=None, network=None*)  
Ping a message queue endpoint.

**class** SoftLayer.managers.messaging.**QueueAuth** (*endpoint, username, api\_key, auth\_token=None*)  
SoftLayer Message Queue authentication for requests.

**Parameters**

- **endpoint** – endpoint URL

- **username** – SoftLayer username
- **api\_key** – SoftLayer API Key
- **auth\_token** – (optional) Starting auth token

**auth()**  
Authenticate.

**handle\_error**(*resp*, \*\*\_)  
Handle errors.

### 3.2.12 SoftLayer.metadata

Metadata Manager/helpers

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.metadata.MetadataManager` (*client=None, timeout=5*)

Provides an interface for the SoftLayer metadata service.

See product information here: [http://sldn.softlayer.com/reference/services/SoftLayer\\_Resource\\_Metadata](http://sldn.softlayer.com/reference/services/SoftLayer_Resource_Metadata)

This provides metadata about the resource it is called from. See `METADATA_ATTRIBUTES` for full list of attributes.

Usage:

```
>>> import SoftLayer
>>> client = SoftLayer.create_client_from_env()
>>> from SoftLayer import MetadataManager
>>> meta = MetadataManager(client)
>>> meta.get('datacenter')
'dal05'
>>> meta.get('fqdn')
'test.example.com'
```

**Parameters** *client* (`SoftLayer.API.BaseClient`) – the client instance

**get** (*name*, *param=None*)  
Retrieve a metadata attribute.

#### Parameters

- **name** (*string*) – name of the attribute to retrieve. See *attrs*
- **param** – Required parameter for some attributes

**private\_network** (\*\**kwargs*)  
Returns details about the private network.

#### Parameters

- **router** (*boolean*) – True to return router details
- **vlan** (*boolean*) – True to return vlan details
- **vlan\_ids** (*boolean*) – True to return `vlan_ids`

**public\_network** (\*\**kwargs*)  
Returns details about the public network.

#### Parameters

- **router** (*boolean*) – True to return router details
- **vlan** (*boolean*) – True to return vlan details
- **vlan\_ids** (*boolean*) – True to return vlan\_ids

metadata.**METADATA\_ATTRIBUTES** = ['datacenter', 'domain', 'backend\_mac', 'primary\_ip', 'prim

### 3.2.13 SoftLayer.network

Network Manager/helpers

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.network.NetworkManager` (*client*)

Manage SoftLayer network objects: VLANs, subnets, IPs and rwhois

See product information here: <http://www.softlayer.com/networking>

**Parameters** **client** (*SoftLayer.API.BaseClient*) – the client instance

**add\_global\_ip** (*version=4, test\_order=False*)

Adds a global IP address to the account.

**Parameters**

- **version** (*int*) – Specifies whether this is IPv4 or IPv6
- **test\_order** (*bool*) – If true, this will only verify the order.

**add\_securitygroup\_rule** (*group\_id, remote\_ip=None, remote\_group=None, direction=None, ethertype=None, port\_max=None, port\_min=None, protocol=None*)

Add a rule to a security group

**Parameters**

- **group\_id** (*int*) – The ID of the security group to add this rule to
- **remote\_ip** (*str*) – The remote IP or CIDR to enforce the rule on
- **remote\_group** (*int*) – The remote security group ID to enforce the rule on
- **direction** (*str*) – The direction to enforce (egress or ingress)
- **ethertype** (*str*) – The ethertype to enforce (IPv4 or IPv6)
- **port\_max** (*int*) – The upper port bound to enforce (icmp code if the protocol is icmp)
- **port\_min** (*int*) – The lower port bound to enforce (icmp type if the protocol is icmp)
- **protocol** (*str*) – The protocol to enforce (icmp, udp, tcp)

**add\_securitygroup\_rules** (*group\_id, rules*)

Add rules to a security group

**Parameters**

- **group\_id** (*int*) – The ID of the security group to add the rules to
- **rules** (*list*) – The list of rule dictionaries to add

**add\_subnet** (*subnet\_type, quantity=None, vlan\_id=None, version=4, test\_order=False*)

Orders a new subnet

**Parameters**

- **subnet\_type** (*str*) – Type of subnet to add: private, public, global

- **quantity** (*int*) – Number of IPs in the subnet
- **vlan\_id** (*int*) – VLAN id for the subnet to be placed into
- **version** (*int*) – 4 for IPv4, 6 for IPv6
- **test\_order** (*bool*) – If true, this will only verify the order.

**assign\_global\_ip** (*global\_ip\_id, target*)

Assigns a global IP address to a specified target.

**Parameters**

- **global\_ip\_id** (*int*) – The ID of the global IP being assigned
- **target** (*string*) – The IP address to assign

**attach\_securitygroup\_component** (*group\_id, component\_id*)

Attaches a network component to a security group.

**Parameters**

- **group\_id** (*int*) – The ID of the security group
- **component\_id** (*int*) – The ID of the network component to attach

**attach\_securitygroup\_components** (*group\_id, component\_ids*)

Attaches network components to a security group.

**Parameters**

- **group\_id** (*int*) – The ID of the security group
- **component\_ids** (*list*) – The IDs of the network components to attach

**cancel\_global\_ip** (*global\_ip\_id*)

Cancels the specified global IP address.

**Parameters** **id** (*int*) – The ID of the global IP to be cancelled.

**cancel\_subnet** (*subnet\_id*)

Cancels the specified subnet.

**Parameters** **subnet\_id** (*int*) – The ID of the subnet to be cancelled.

**create\_securitygroup** (*name=None, description=None*)

Creates a security group.

**Parameters**

- **name** (*string*) – The name of the security group
- **description** (*string*) – The description of the security group

**delete\_securitygroup** (*group\_id*)

Deletes the specified security group.

**Parameters** **group\_id** (*int*) – The ID of the security group

**detach\_securitygroup\_component** (*group\_id, component\_id*)

Detaches a network component from a security group.

**Parameters**

- **group\_id** (*int*) – The ID of the security group
- **component\_id** (*int*) – The ID of the component to detach

**detach\_securitygroup\_components** (*group\_id*, *component\_ids*)

Detaches network components from a security group.

**Parameters**

- **group\_id** (*int*) – The ID of the security group
- **component\_ids** (*list*) – The IDs of the network components to detach

**edit\_rwhois** (*abuse\_email=None*, *address1=None*, *address2=None*, *city=None*, *company\_name=None*, *country=None*, *first\_name=None*, *last\_name=None*, *postal\_code=None*, *private\_residence=None*, *state=None*)

Edit rwhois record.

**edit\_securitygroup** (*group\_id*, *name=None*, *description=None*)

Edit security group details.

**Parameters**

- **group\_id** (*int*) – The ID of the security group
- **name** (*string*) – The name of the security group
- **description** (*string*) – The description of the security group

**edit\_securitygroup\_rule** (*group\_id*, *rule\_id*, *remote\_ip=None*, *remote\_group=None*, *direction=None*, *ethertype=None*, *port\_max=None*, *port\_min=None*, *protocol=None*)

Edit a security group rule.

**Parameters**

- **group\_id** (*int*) – The ID of the security group the rule belongs to
- **rule\_id** (*int*) – The ID of the rule to edit
- **remote\_ip** (*str*) – The remote IP or CIDR to enforce the rule on
- **remote\_group** (*int*) – The remote security group ID to enforce the rule on
- **direction** (*str*) – The direction to enforce (egress or ingress)
- **ethertype** (*str*) – The ethertype to enforce (IPv4 or IPv6)
- **port\_max** (*str*) – The upper port bound to enforce
- **port\_min** (*str*) – The lower port bound to enforce
- **protocol** (*str*) – The protocol to enforce (icmp, udp, tcp)

**get\_nas\_credentials** (*identifier*, *\*\*kwargs*)

Returns a list of IDs of VLANs which match the given VLAN name.

**Parameters** **instance\_id** (*integer*) – the instance ID

**Returns** A dictionary containing a large amount of information about the specified instance.

**get\_rwhois** ()

Returns the RWhois information about the current account.

**Returns** A dictionary containing the account's RWhois information.

**get\_securitygroup** (*group\_id*, *\*\*kwargs*)

Returns the information about the given security group.

**Parameters** **id** (*string*) – The ID for the security group

**Returns** A diction of information about the security group

**get\_subnet** (*subnet\_id*, *\*\*kwargs*)

Returns information about a single subnet.

**Parameters** *id* (*string*) – Either the ID for the subnet or its network identifier

**Returns** A dictionary of information about the subnet

**get\_vlan** (*vlan\_id*)

Returns information about a single VLAN.

**Parameters** *id* (*int*) – The unique identifier for the VLAN

**Returns** A dictionary containing a large amount of information about the specified VLAN.

**ip\_lookup** (*ip\_address*)

Looks up an IP address and returns network information about it.

**Parameters** *ip\_address* (*string*) – An IP address. Can be IPv4 or IPv6

**Returns** A dictionary of information about the IP

**list\_global\_ips** (*version=None*, *identifier=None*, *\*\*kwargs*)

Returns a list of all global IP address records on the account.

**Parameters**

- **version** (*int*) – Only returns IPs of this version (4 or 6)
- **identifier** (*string*) – If specified, the list will only contain the global ips matching this network identifier.

**list\_securitygroup\_rules** (*group\_id*)

List security group rules associated with a security group.

**Parameters** *group\_id* (*int*) – The security group to list rules for

**list\_securitygroups** (*\*\*kwargs*)

List security groups.

**list\_subnets** (*identifier=None*, *datacenter=None*, *version=0*, *subnet\_type=None*, *network\_space=None*, *\*\*kwargs*)

Display a list of all subnets on the account.

This provides a quick overview of all subnets including information about data center residence and the number of devices attached.

**Parameters**

- **identifier** (*string*) – If specified, the list will only contain the subnet matching this network identifier.
- **datacenter** (*string*) – If specified, the list will only contain subnets in the specified data center.
- **version** (*int*) – Only returns subnets of this version (4 or 6).
- **subnet\_type** (*string*) – If specified, it will only returns subnets of this type.
- **network\_space** (*string*) – If specified, it will only returns subnets with the given address space label.
- **\*\*kwargs** (*dict*) – response-level options (mask, limit, etc.)

**list\_vlans** (*datacenter=None*, *vlan\_number=None*, *name=None*, *\*\*kwargs*)

Display a list of all VLANs on the account.

This provides a quick overview of all VLANs including information about data center residence and the number of devices attached.

#### Parameters

- **datacenter** (*string*) – If specified, the list will only contain VLANs in the specified data center.
- **vlan\_number** (*int*) – If specified, the list will only contain the VLAN matching this VLAN number.
- **name** (*int*) – If specified, the list will only contain the VLAN matching this VLAN name.
- **\*\*kwargs** (*dict*) – response-level options (mask, limit, etc.)

**remove\_securitygroup\_rule** (*group\_id, rule\_id*)

Remove a rule from a security group.

#### Parameters

- **group\_id** (*int*) – The ID of the security group
- **rule\_id** (*int*) – The ID of the rule to remove

**remove\_securitygroup\_rules** (*group\_id, rules*)

Remove rules from a security group.

#### Parameters

- **group\_id** (*int*) – The ID of the security group
- **rules** (*list*) – The list of IDs to remove

**resolve\_global\_ip\_ids** (*identifier*)

Resolve global ip ids.

**resolve\_subnet\_ids** (*identifier*)

Resolve subnet ids.

**resolve\_vlan\_ids** (*identifier*)

Resolve VLAN ids.

**summary\_by\_datacenter** ()

Summary of the networks on the account, grouped by data center.

The resultant dictionary is primarily useful for statistical purposes. It contains count information rather than raw data. If you want raw information, see the `list_vlans()` method instead.

**Returns** A dictionary keyed by data center with the data containing a set of counts for subnets, hardware, virtual servers, and other objects residing within that data center.

**unassign\_global\_ip** (*global\_ip\_id*)

Unassigns a global IP address from a target.

**Parameters** **id** (*int*) – The ID of the global IP being unassigned

## 3.2.14 SoftLayer.ordering

Ordering Manager

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.ordering.OrderingManager` (*client*)

Manager to help ordering via the SoftLayer API.

**Parameters** `client` (*SoftLayer.API.BaseClient*) – the client instance

**static** `filter_outlet_packages` (*packages*)

Remove packages designated as OUTLET.

Those type of packages must be handled in a different way, and they are not supported at the moment.

**Parameters** `packages` – Dictionary of packages. Name and description keys must be present in each of them.

**generate\_order** (*package\_keyname, location, item\_keynames, complex\_type=None, hourly=True, preset\_keyname=None, extras=None, quantity=1*)

Generates an order with the given package and prices.

This function takes in parameters needed for an order and generates an order dictionary. This dictionary can then be used in either `verify` or `placeOrder()`.

#### Parameters

- **package\_keyname** (*str*) – The keyname for the package being ordered
- **location** (*str*) – The datacenter location string for ordering (Ex: DALLAS13)
- **item\_keynames** (*list*) – The list of item keyname strings to order. To see list of possible keynames for a package, use `list_items()` (or `slcli order item-list`)
- **complex\_type** (*str*) – The complex type to send with the order. Typically begins with `SoftLayer_Container_Product_Order_`.
- **hourly** (*bool*) – If true, uses hourly billing, otherwise uses monthly billing
- **preset\_keyname** (*string*) – If needed, specifies a preset to use for that package. To see a list of possible keynames for a package, use `list_preset()` (or `slcli order preset-list`)
- **extras** (*dict*) – The extra data for the order in dictionary format. Example: A VSI order requires hostname and domain to be set, so extras will look like the following: `{'virtualGuests': [{'hostname': 'test', 'domain': 'softlayer.com'}]}`
- **quantity** (*int*) – The number of resources to order

**generate\_order\_template** (*quote\_id, extra, quantity=1*)

Generate a complete order template.

#### Parameters

- **quote\_id** (*int*) – ID of target quote
- **extra** (*list*) – List of dictionaries that have extra details about the order such as hostname or domain names for virtual servers or hardware nodes
- **quantity** (*int*) – Number of ~things~ to order

**static** `get_item_price_id` (*core, prices*)

get item price id

**get\_item\_prices** (*package\_id*)

Get item prices.

Retrieve a `SoftLayer_Product_Package` item prices record.

**Parameters** `package_id` (*int*) – package identifier.

**Returns** A list of price IDs associated with the given package.

**get\_location\_id** (*location*)

Finds the location ID of a given datacenter

This is mostly used so either a dc name, or regions keyname can be used when ordering :param str location: Region Keyname (DALLAS13) or datacenter name (dal13) :returns: integer id of the datacenter

**static get\_only\_active\_packages** (*packages*)

Return only active packages.

If a package is active, it is eligible for ordering This will inspect the ‘isActive’ property on the provided packages

**Parameters packages** – Dictionary of packages, isActive key must be present

**get\_order\_container** (*quote\_id*)

Generate an order container from a quote object.

**Parameters quote\_id** – ID number of target quote

**get\_package\_by\_key** (*package\_keyname, mask=None*)

Get a single package with a given key.

If no packages are found, returns None

**Parameters**

- **package\_keyname** – string representing the package key name we are interested in.
- **mask** (*string*) – Mask to specify the properties we want to retrieve

**get\_package\_by\_type** (*package\_type, mask=None*)

Get a single package of a given type.

Syntactic sugar to retrieve a single package of a given type. If multiple packages share the given type, this will return the first one returned by the API. If no packages are found, returns None

**Parameters package\_type** (*string*) – representing the package type key name we are interested in

**get\_package\_id\_by\_type** (*package\_type*)

Return the package ID of a Product Package with a given type.

**Parameters package\_type** (*string*) – representing the package type key name we are interested in

**Raises ValueError** – when no package of the given type is found

**get\_packages\_of\_type** (*package\_types, mask=None*)

Get packages that match a certain type.

Each ordering package has a type, so return all packages that match the types we are looking for

**Parameters**

- **package\_types** (*list*) – List of strings representing the package type keynames we are interested in.
- **mask** (*string*) – Mask to specify the properties we want to retrieve

**get\_preset\_by\_key** (*package\_keyname, preset\_keyname, mask=None*)

Gets a single preset with the given key.

**get\_preset\_prices** (*preset*)

Get preset item prices.

Retrieve a SoftLayer\_Product\_Package\_Preset record.

**Parameters preset** (*int*) – preset identifier.

**Returns** A list of price IDs associated with the given preset\_id.

**get\_price\_id\_list** (*package\_keyname, item\_keynames, core=None*)

Converts a list of item keynames to a list of price IDs.

This function is used to convert a list of item keynames into a list of price IDs that are used in the Product\_Order verifyOrder() and placeOrder() functions.

**Parameters**

- **package\_keyname** (*str*) – The package associated with the prices
- **item\_keynames** (*list*) – A list of item keyname strings
- **core** (*str*) – preset guest core capacity.

**Returns** A list of price IDs associated with the given item keynames in the given package

**get\_quote\_details** (*quote\_id*)

Retrieve quote details.

**Parameters** **quote\_id** – ID number of target quote

**get\_quotes** ()

Retrieve a list of quotes.

**Returns** a list of SoftLayer\_Billing\_Order\_Quote

**list\_categories** (*package\_keyname, \*\*kwargs*)

List the categories for the given package.

**Parameters** **package\_keyname** (*str*) – The package for which to get the categories.

**Returns** List of categories associated with the package

**list\_items** (*package\_keyname, \*\*kwargs*)

List the items for the given package.

**Parameters** **package\_keyname** (*str*) – The package for which to get the items.

**Returns** List of items in the package

**list\_packages** (*\*\*kwargs*)

List active packages.

**Returns** List of active packages.

**list\_presets** (*package\_keyname, \*\*kwargs*)

Gets active presets for the given package.

**Parameters** **package\_keyname** (*str*) – The package for which to get presets

**Returns** A list of package presets that can be used for ordering

**order\_quote** (*quote\_id, extra, quantity=1*)

Places an order using a quote

**Parameters**

- **quote\_id** (*int*) – ID for the target quote
- **hostnames** (*list*) – hostnames of the servers
- **domain** (*string*) – domain of the new server
- **quantity** (*int*) – Quantity to override default

**package\_locations** (*package\_keyname*)

List datacenter locations for a package keyname

**Parameters** `package_keyname` (*str*) – The package for which to get the items.

**Returns** List of locations a package is orderable in

**place\_order** (*package\_keyname, location, item\_keynames, complex\_type=None, hourly=True, preset\_keyname=None, extras=None, quantity=1*)

Places an order with the given package and prices.

This function takes in parameters needed for an order and places the order.

#### Parameters

- **package\_keyname** (*str*) – The keyname for the package being ordered
- **location** (*str*) – The datacenter location string for ordering (Ex: DALLAS13)
- **item\_keynames** (*list*) – The list of item keyname strings to order. To see list of possible keynames for a package, use `list_items()` (or `slcli order item-list`)
- **complex\_type** (*str*) – The complex type to send with the order. Typically begins with `SoftLayer_Container_Product_Order_`.
- **hourly** (*bool*) – If true, uses hourly billing, otherwise uses monthly billing
- **preset\_keyname** (*string*) – If needed, specifies a preset to use for that package. To see a list of possible keynames for a package, use `list_preset()` (or `slcli order preset-list`)
- **extras** (*dict*) – The extra data for the order in dictionary format. Example: A VSI order requires hostname and domain to be set, so extras will look like the following: `{'virtualGuests': [{'hostname': 'test', 'domain': 'softlayer.com'}]}`
- **quantity** (*int*) – The number of resources to order

**place\_quote** (*package\_keyname, location, item\_keynames, complex\_type=None, preset\_keyname=None, extras=None, quantity=1, quote\_name=None, send\_email=False*)

Place a quote with the given package and prices.

This function takes in parameters needed for an order and places the quote.

#### Parameters

- **package\_keyname** (*str*) – The keyname for the package being ordered
- **location** (*str*) – The datacenter location string for ordering (Ex: DALLAS13)
- **item\_keynames** (*list*) – The list of item keyname strings to order. To see list of possible keynames for a package, use `list_items()` (or `slcli order item-list`)
- **complex\_type** (*str*) – The complex type to send with the order. Typically begins with `SoftLayer_Container_Product_Order_`.
- **preset\_keyname** (*string*) – If needed, specifies a preset to use for that package. To see a list of possible keynames for a package, use `list_preset()` (or `slcli order preset-list`)
- **extras** (*dict*) – The extra data for the order in dictionary format. Example: A VSI order requires hostname and domain to be set, so extras will look like the following: `{'virtualGuests': [{'hostname': 'test', 'domain': 'softlayer.com'}]}`
- **quantity** (*int*) – The number of resources to order
- **quote\_name** (*string*) – A custom name to be assigned to the quote (optional).
- **send\_email** (*bool*) – This flag indicates that the quote should be sent to the email address associated with the account or order.

**verify\_order** (*package\_keyname, location, item\_keynames, complex\_type=None, hourly=True, preset\_keyname=None, extras=None, quantity=1*)

Verifies an order with the given package and prices.

This function takes in parameters needed for an order and verifies the order to ensure the given items are compatible with the given package.

#### Parameters

- **package\_keyname** (*str*) – The keyname for the package being ordered
- **location** (*str*) – The datacenter location string for ordering (Ex: DALLAS13)
- **item\_keynames** (*list*) – The list of item keyname strings to order. To see list of possible keynames for a package, use `list_items()` (or `slcli order item-list`)
- **complex\_type** (*str*) – The complex type to send with the order. Typically begins with `SoftLayer_Container_Product_Order_`.
- **hourly** (*bool*) – If true, uses hourly billing, otherwise uses monthly billing
- **preset\_keyname** (*string*) – If needed, specifies a preset to use for that package. To see a list of possible keynames for a package, use `list_preset()` (or `slcli order preset-list`)
- **extras** (*dict*) – The extra data for the order in dictionary format. Example: A VSI order requires hostname and domain to be set, so extras will look like the following: `‘virtualGuests’: [{‘hostname’: ‘test’, ‘domain’: ‘softlayer.com’}]}`
- **quantity** (*int*) – The number of resources to order

**verify\_quote** (*quote\_id, extra, quantity=1*)

Verifies that a quote order is valid.

#### Parameters

- **quote\_id** (*int*) – ID for the target quote
- **hostnames** (*list*) – hostnames of the servers
- **domain** (*string*) – domain of the new servers
- **quantity** (*int*) – Quantity to override default

### 3.2.15 SoftLayer.sshkey

SSH Key Manager/helpers

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.sshkey.SshKeyManager` (*client*)

Manages account SSH keys in SoftLayer.

See product information here: <https://knowledge.softlayer.com/procedure/ssh-keys>

**Parameters** **client** (`SoftLayer.API.BaseClient`) – the client instance

**add\_key** (*key, label, notes=None*)

Adds a new SSH key to the account.

#### Parameters

- **key** (*string*) – The SSH key to add
- **label** (*string*) – The label for the key
- **notes** (*string*) – Additional notes for the key

**Returns** A dictionary of the new key's information.

**delete\_key** (*key\_id*)

Permanently deletes an SSH key from the account.

**Parameters** **key\_id** (*int*) – The ID of the key to delete

**edit\_key** (*key\_id*, *label=None*, *notes=None*)

Edits information about an SSH key.

**Parameters**

- **key\_id** (*int*) – The ID of the key to edit
- **label** (*string*) – The new label for the key
- **notes** (*string*) – Notes to set or change on the key

**Returns** A Boolean indicating success or failure

**get\_key** (*key\_id*)

Returns full information about a single SSH key.

**Parameters** **key\_id** (*int*) – The ID of the key to retrieve

**Returns** A dictionary of information about the key

**list\_keys** (*label=None*)

Lists all SSH keys on the account.

**Parameters** **label** (*string*) – Filter list based on SSH key label

**Returns** A list of dictionaries with information about each key

**resolve\_ids** (*identifier*)

Takes a string and tries to resolve to a list of matching ids.

What exactly 'identifier' can be depends on the resolvers

**Parameters** **identifier** (*string*) – identifying string

**Returns** list

### 3.2.16 SoftLayer.ssl

SSL Manager/helpers

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.ssl.SSLManager` (*client*)

Manages SSL certificates in SoftLayer.

See product information here: <http://www.softlayer.com/ssl-certificates>

Example:

```
# Initialize the Manager.
# env variables. These can also be specified in ~/.softlayer,
# or passed directly to SoftLayer.Client()
# SL_USERNAME = YOUR_USERNAME
# SL_API_KEY = YOUR_API_KEY
import SoftLayer
client = SoftLayer.Client()
mgr = SoftLayer.SSLManager(client)
```

**Parameters** `client` (*SoftLayer.API.BaseClient*) – the client instance

**add\_certificate** (*certificate*)

Creates a new certificate.

**Parameters** `certificate` (*dict*) – A dictionary representing the parts of the certificate. See [developer.softlayer.com](http://developer.softlayer.com) for more info.

Example:

```
cert = ??
result = mgr.add_certificate(certificate=cert)
```

**edit\_certificate** (*certificate*)

Updates a certificate with the included options.

The provided dict must include an 'id' key and value corresponding to the certificate ID that should be updated.

**Parameters** `certificate` (*dict*) – the certificate to update.

Example:

```
# Updates the cert id 1234
cert['id'] = 1234
cert['certificate'] = ??
result = mgr.edit_certificate(certificate=cert)
```

**get\_certificate** (*cert\_id*)

Gets a certificate with the ID specified.

**Parameters** `cert_id` (*integer*) – the certificate ID to retrieve

Example:

```
cert = mgr.get_certificate(cert_id=1234)
print(cert)
```

**list\_certs** (*method='all'*)

List all certificates.

**Parameters** `method` (*string*) – The type of certificates to list. Options are 'all', 'expired', and 'valid'.

**Returns** A list of dictionaries representing the requested SSL certs.

Example:

```
# Get all valid SSL certs
certs = mgr.list_certs(method='valid')
print(certs)
```

**remove\_certificate** (*cert\_id*)

Removes a certificate.

**Parameters** `cert_id` (*integer*) – a certificate ID to remove

Example:

```
# Removes certificate with id 1234
result = mgr.remove_certificate(cert_id = 1234)
```

### 3.2.17 SoftLayer.ticket

Ticket Manager/helpers

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.ticket.TicketManager` (*client*)

Manages SoftLayer support tickets.

See product information here: <http://www.softlayer.com/support>

**Parameters** `client` (*SoftLayer.API.BaseClient*) – the client instance

**attach\_hardware** (*ticket\_id=None, hardware\_id=None*)

Attach hardware to a ticket.

**Parameters**

- **ticket\_id** (*integer*) – the id of the ticket to attach to
- **hardware\_id** (*integer*) – the id of the hardware to attach

**Returns** dict – The new ticket attachment

**attach\_virtual\_server** (*ticket\_id=None, virtual\_id=None*)

Attach a virtual server to a ticket.

**Parameters**

- **ticket\_id** (*integer*) – the id of the ticket to attach to
- **virtual\_id** (*integer*) – the id of the virtual server to attach

**Returns** dict – The new ticket attachment

**create\_ticket** (*title=None, body=None, subject=None, priority=None*)

Create a new ticket.

**Parameters**

- **title** (*string*) – title for the new ticket
- **body** (*string*) – body for the new ticket
- **subject** (*integer*) – id of the subject to be assigned to the ticket
- **priority** (*integer*) – Value from 1 (highest) to 4 (lowest)

**detach\_hardware** (*ticket\_id=None, hardware\_id=None*)

Detach hardware from a ticket.

**Parameters**

- **ticket\_id** – the id of the ticket to detach from
- **hardware\_id** – the id of the hardware to detach

**Returns** bool – Whether the detachment was successful

**detach\_virtual\_server** (*ticket\_id=None, virtual\_id=None*)

Detach a virtual server from a ticket.

**Parameters**

- **ticket\_id** – the id of the ticket to detach from
- **virtual\_id** – the id of the virtual server to detach

**Returns** bool – Whether the detachment was successful

**get\_ticket** (*ticket\_id*)

Get details about a ticket.

**Parameters** **ticket\_id** (*integer*) – the ticket ID

**Returns** dict – information about the specified ticket

**list\_subjects** ()

List all ticket subjects.

**list\_tickets** (*open\_status=True, closed\_status=True*)

List all tickets.

**Parameters**

- **open\_status** (*boolean*) – include open tickets
- **closed\_status** (*boolean*) – include closed tickets

**resolve\_ids** (*identifier*)

Takes a string and tries to resolve to a list of matching ids.

What exactly ‘identifier’ can be depends on the resolvers

**Parameters** **identifier** (*string*) – identifying string

**Returns** list

**update\_ticket** (*ticket\_id=None, body=None*)

Update a ticket.

**Parameters**

- **ticket\_id** (*integer*) – the id of the ticket to update
- **body** (*string*) – entry to update in the ticket

**upload\_attachment** (*ticket\_id=None, file\_path=None, file\_name=None*)

Upload an attachment to a ticket.

**Parameters**

- **ticket\_id** (*integer*) – the id of the ticket to upload the attachment to
- **file\_path** (*string*) – The path of the attachment to be uploaded
- **file\_name** (*string*) – The name of the attachment shown in the ticket

**Returns** dict – The uploaded attachment

### 3.2.18 SoftLayer.vs

VS Manager/helpers

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.managers.vs.VSManager` (*client, ordering\_manager=None*)

Manages SoftLayer Virtual Servers.

See product information here: <http://www.softlayer.com/virtual-servers>

Example:

```
# Initialize the VSManager.
# env variables. These can also be specified in ~/.softlayer,
# or passed directly to SoftLayer.Client()
# SL_USERNAME = YOUR_USERNAME
# SL_API_KEY = YOUR_API_KEY
import SoftLayer
client = SoftLayer.Client()
mgr = SoftLayer.VSManager(client)
```

### Parameters

- **client** (*SoftLayer.API.BaseClient*) – the client instance
- **ordering\_manager** (*SoftLayer.managers.OrderingManager*) – an optional manager to handle ordering. If none is provided, one will be auto initialized.

**cancel\_instance** (*instance\_id*)

Cancel an instance immediately, deleting all its data.

**Parameters** **instance\_id** (*integer*) – the instance ID to cancel

Example:

```
# Cancels instance 12345
mgr.cancel_instance(12345)
```

**capture** (*instance\_id, name, additional\_disks=False, notes=None*)

Capture one or all disks from a VS to a SoftLayer image.

Parameters set to None will be ignored and not attempted to be updated.

### Parameters

- **instance\_id** (*integer*) – the instance ID to edit
- **name** (*string*) – name assigned to the image
- **additional\_disks** (*bool*) – set to true to include all additional attached storage devices
- **notes** (*string*) – notes about this particular image

**Returns** dictionary – information about the capture transaction.

**Example::** name = “Testing Images” notes = “Some notes about this image” result = mgr.capture(instance\_id=12345, name=name, notes=notes)

**change\_port\_speed** (*instance\_id, public, speed*)

Allows you to change the port speed of a virtual server’s NICs.

Example:

```
#change the Public interface to 10Mbps on instance 12345
result = mgr.change_port_speed(instance_id=12345,
                               public=True, speed=10)
# result will be True or an Exception
```

### Parameters

- **instance\_id** (*int*) – The ID of the VS

- **public** (*bool*) – Flag to indicate which interface to change. True (default) means the public interface. False indicates the private interface.
- **speed** (*int*) – The port speed to set.

**Warning:** A port speed of 0 will disable the interface.

**create\_instance** (\*\*kwargs)  
Creates a new virtual server instance.

**Warning:** This will add charges to your account

Example:

```
new_vsi = {
    'domain': u'test01.labs.sftlyr.ws',
    'hostname': u'minion05',
    'datacenter': u'hkg02',
    'flavor': 'BL1_1X2X100'
    'dedicated': False,
    'private': False,
    'os_code' : u'UBUNTU_LATEST',
    'hourly': True,
    'ssh_keys': [1234],
    'disks': ('100', '25'),
    'local_disk': True,
    'tags': 'test, pleaseCancel',
    'public_security_groups': [12, 15]
}

vsi = mgr.create_instance(**new_vsi)
# vsi will have the newly created vsi details if done properly.
print vsi
```

### Parameters

- **cpus** (*int*) – The number of virtual CPUs to include in the instance.
- **memory** (*int*) – The amount of RAM to order.
- **hourly** (*bool*) – Flag to indicate if this server should be billed hourly (default) or monthly.
- **hostname** (*string*) – The hostname to use for the new server.
- **domain** (*string*) – The domain to use for the new server.
- **local\_disk** (*bool*) – Flag to indicate if this should be a local disk (default) or a SAN disk.
- **datacenter** (*string*) – The short name of the data center in which the VS should reside.
- **os\_code** (*string*) – The operating system to use. Cannot be specified if `image_id` is specified.

- **image\_id** (*int*) – The GUID of the image to load onto the server. Cannot be specified if `os_code` is specified.
- **dedicated** (*bool*) – Flag to indicate if this should be housed on a dedicated or shared host (default). This will incur a fee on your account.
- **public\_vlan** (*int*) – The ID of the public VLAN on which you want this VS placed.
- **public\_security\_groups** (*list*) – The list of security group IDs to apply to the public interface
- **private\_security\_groups** (*list*) – The list of security group IDs to apply to the private interface
- **private\_vlan** (*int*) – The ID of the private VLAN on which you want this VS placed.
- **disks** (*list*) – A list of disk capacities for this server.
- **post\_uri** (*string*) – The URI of the post-install script to run after reload
- **private** (*bool*) – If true, the VS will be provisioned only with access to the private network. Defaults to false
- **ssh\_keys** (*list*) – The SSH keys to add to the root user
- **nic\_speed** (*int*) – The port speed to set
- **tags** (*string*) – tags to set on the VS as a comma separated list
- **flavor** (*string*) – The key name of the public virtual server flavor being ordered.
- **host\_id** (*int*) – The host id of a dedicated host to provision a dedicated host virtual server on.

#### **create\_instances** (*config\_list*)

Creates multiple virtual server instances.

This takes a list of dictionaries using the same arguments as `create_instance()`.

**Warning:** This will add charges to your account

Example:

```
# Define the instance we want to create.
new_vsi = {
    'domain': u'test01.labs.sftlyr.ws',
    'hostname': u'minion05',
    'datacenter': u'hkg02',
    'flavor': 'BL1_1X2X100'
    'dedicated': False,
    'private': False,
    'os_code' : u'UBUNTU_LATEST',
    'hourly': True,
    'ssh_keys': [1234],
    'disks': ('100', '25'),
    'local_disk': True,
    'tags': 'test, pleaseCancel',
    'public_security_groups': [12, 15]
}
```

(continues on next page)

(continued from previous page)

```
# using .copy() so we can make changes to individual nodes
instances = [new_vsi.copy(), new_vsi.copy(), new_vsi.copy()]

# give each its own hostname, not required.
instances[0]['hostname'] = "multi-test01"
instances[1]['hostname'] = "multi-test02"
instances[2]['hostname'] = "multi-test03"

vsi = mgr.create_instances(config_list=instances)
#vsi will be a dictionary of all the new virtual servers
print vsi
```

**edit** (*instance\_id*, *userdata=None*, *hostname=None*, *domain=None*, *notes=None*, *tags=None*)  
 Edit hostname, domain name, notes, and/or the user data of a VS.

Parameters set to None will be ignored and not attempted to be updated.

#### Parameters

- **instance\_id** (*integer*) – the instance ID to edit
- **userdata** (*string*) – user data on VS to edit. If none exist it will be created
- **hostname** (*string*) – valid hostname
- **domain** (*string*) – valid domain name
- **notes** (*string*) – notes about this particular VS
- **tags** (*string*) – tags to set on the VS as a comma separated list. Use the empty string to remove all tags.

**Returns** bool – True or an Exception

**Example::** # Change the hostname on instance 12345 to ‘something’ result = mgr.edit(instance\_id=12345, hostname=”something”) #result will be True or an Exception

**get\_create\_options** (*\*\*kwargs*)

Retrieves the available options for creating a VS.

**Returns** A dictionary of creation options.

Example:

```
# Prints out the create option dictionary
options = mgr.get_create_options()
print (options)
```

**get\_instance** (*\*\*kwargs*)

Get details about a virtual server instance.

**Parameters** **instance\_id** (*integer*) – the instance ID

**Returns** A dictionary containing a large amount of information about the specified instance.

Example:

```
# Print out instance ID 12345.
vsi = mgr.get_instance(12345)
print vsi
```

(continues on next page)

(continued from previous page)

```
# Print out only FQDN and primaryIP for instance 12345
object_mask = "mask[fullyQualifiedDomainName,primaryIpAddress]"
vsi = mgr.get_instance(12345, mask=mask)
print vsi
```

**list\_instances** (\*\*kwargs)

Retrieve a list of all virtual servers on the account.

Example:

```
# Print out a list of hourly instances in the DAL05 data center.

for vsi in mgr.list_instances(hourly=True, datacenter='dal05'):
    print vsi['fullyQualifiedDomainName'], vsi['primaryIpAddress']

# Using a custom object-mask. Will get ONLY what is specified
object_mask = "mask[hostname,monitoringRobot[robotStatus]]"
for vsi in mgr.list_instances(mask=object_mask, hourly=True):
    print vsi
```

**Parameters**

- **hourly** (*boolean*) – include hourly instances
- **monthly** (*boolean*) – include monthly instances
- **tags** (*list*) – filter based on list of tags
- **cpus** (*integer*) – filter based on number of CPUS
- **memory** (*integer*) – filter based on amount of memory
- **hostname** (*string*) – filter based on hostname
- **domain** (*string*) – filter based on domain
- **local\_disk** (*string*) – filter based on local\_disk
- **datacenter** (*string*) – filter based on datacenter
- **nic\_speed** (*integer*) – filter based on network speed (in MBPS)
- **public\_ip** (*string*) – filter based on public ip address
- **private\_ip** (*string*) – filter based on private ip address
- **\*\*kwargs** (*dict*) – response-level options (mask, limit, etc.)

**Returns** Returns a list of dictionaries representing the matching virtual servers

**reload\_instance** (*instance\_id*, *post\_uri=None*, *ssh\_keys=None*, *image\_id=None*)

Perform an OS reload of an instance.

**Parameters**

- **instance\_id** (*integer*) – the instance ID to reload
- **post\_url** (*string*) – The URI of the post-install script to run after reload
- **ssh\_keys** (*list*) – The SSH keys to add to the root user
- **image\_id** (*int*) – The GUID of the image to load onto the server

**Warning:** This will reformat the primary drive. Post-provision script MUST be HTTPS for it to be executed.

Example:

```
# Reload instance ID 12345 then run a custom post-provision script.
# Post-provision script MUST be HTTPS for it to be executed.
post_uri = 'https://somehost.com/bootstrap.sh'
vsi = mgr.reload_instance(12345, post_uri=post_url)
```

**rescue** (*instance\_id*)

Reboot a VSI into the Xen rescue kernel.

**Parameters** *instance\_id* (*integer*) – the instance ID to rescue

**Returns** bool – True or an Exception

**Example::** # Puts instance 12345 into rescue mode result = mgr.rescue(instance\_id=12345)

**resolve\_ids** (*identifier*)

Takes a string and tries to resolve to a list of matching ids.

What exactly ‘identifier’ can be depends on the resolvers

**Parameters** *identifier* (*string*) – identifying string

**Returns** list

**set\_tags** (*\*\*kwargs*)

Sets tags on a guest with a retry decorator

Just calls guest.setTags, but if it fails from an APIError will retry

**upgrade** (*instance\_id*, *cpus=None*, *memory=None*, *nic\_speed=None*, *public=True*, *preset=None*)

Upgrades a VS instance.

Example:

```
# Upgrade instance 12345 to 4 CPUs and 4 GB of memory
import SoftLayer
client = SoftLayer.create_client_from_env()
mgr = SoftLayer.VSManager(client)
mgr.upgrade(12345, cpus=4, memory=4)
```

**Parameters**

- **instance\_id** (*int*) – Instance id of the VS to be upgraded
- **cpus** (*int*) – The number of virtual CPUs to upgrade to of a VS instance.
- **preset** (*string*) – preset assigned to the vsi
- **memory** (*int*) – RAM of the VS to be upgraded to.
- **nic\_speed** (*int*) – The port speed to set
- **public** (*bool*) – CPU will be in Private/Public Node.

**Returns** bool

**verify\_create\_instance** (\*\*kwargs)

Verifies an instance creation command.

Without actually placing an order. See `create_instance()` for a list of available options.

Example:

```
new_vsi = {
    'domain': u'test01.labs.sftlyr.ws',
    'hostname': u'minion05',
    'datacenter': u'hkg02',
    'flavor': 'BL1_1X2X100'
    'dedicated': False,
    'private': False,
    'os_code' : u'UBUNTU_LATEST',
    'hourly': True,
    'ssh_keys': [1234],
    'disks': ('100', '25'),
    'local_disk': True,
    'tags': 'test, pleaseCancel',
    'public_security_groups': [12, 15]
}

vsi = mgr.verify_create_instance(**new_vsi)
# vsi will be a SoftLayer_Container_Product_Order_Virtual_Guest
# if your order is correct. Otherwise you will get an exception
print vsi
```

**wait\_for\_ready** (instance\_id, limit=3600, delay=10, pending=False)

Determine if a VS is ready and available.

In some cases though, that can mean that no transactions are running. The default arguments imply a VS is operational and ready for use by having network connectivity and remote access is available. Setting `pending=True` will ensure future API calls against this instance will not error due to pending transactions such as OS Reloads and cancellations.

#### Parameters

- **instance\_id** (*int*) – The instance ID with the pending transaction
- **limit** (*int*) – The maximum amount of seconds to wait.
- **delay** (*int*) – The number of seconds to sleep before checks. Defaults to 10.
- **pending** (*bool*) – Wait for pending transactions not related to provisioning or reloads such as monitoring.

Example:

```
# Will return once vsi 12345 is ready, or after 10 checks
ready = mgr.wait_for_ready(12345, 10)
```

**wait\_for\_transaction** (\*\*kwargs)

Waits on a VS transaction for the specified amount of time.

This is really just a wrapper for `wait_for_ready(pending=True)`. Provided for backwards compatibility.

#### Parameters

- **instance\_id** (*int*) – The instance ID with the pending transaction
- **limit** (*int*) – The maximum amount of time to wait.

- **delay** (*int*) – The number of seconds to sleep before checks. Defaults to 10.

### 3.2.19 SoftLayer.vs\_capacity

Reserved Capacity Manager and helpers

**license** MIT, see License for more details.

**class** `SoftLayer.managers.vs_capacity.CapacityManager` (*client*, *ordering\_manager=None*)

Manages SoftLayer Reserved Capacity Groups.

Product Information

- [https://console.bluemix.net/docs/vsi/vsi\\_about\\_reserved.html](https://console.bluemix.net/docs/vsi/vsi_about_reserved.html)
- [https://softlayer.github.io/reference/services/SoftLayer\\_Virtual\\_ReservedCapacityGroup/](https://softlayer.github.io/reference/services/SoftLayer_Virtual_ReservedCapacityGroup/)
- [https://softlayer.github.io/reference/services/SoftLayer\\_Virtual\\_ReservedCapacityGroup\\_Instance/](https://softlayer.github.io/reference/services/SoftLayer_Virtual_ReservedCapacityGroup_Instance/)

**Parameters**

- **client** (*SoftLayer.API.BaseClient*) – the client instance
- **ordering\_manager** (*SoftLayer.managers.OrderingManager*) – an optional manager to handle ordering. If none is provided, one will be auto initialized.

**create** (*name, backend\_router\_id, flavor, instances, test=False*)

Orders a Virtual\_ReservedCapacityGroup

**Parameters**

- **name** (*string*) – Name for the new reserved capacity
- **backend\_router\_id** (*int*) – This selects the pod. See `create_options` for a list
- **flavor** (*string*) – Capacity KeyName, see `create_options` for a list
- **instances** (*int*) – Number of guest this capacity can support
- **test** (*bool*) – If True, don't actually order, just test.

**create\_guest** (*capacity\_id, test, guest\_object*)

Turns an empty Reserve Capacity into a real Virtual Guest

**Parameters**

- **capacity\_id** (*int*) – ID of the RESERVED\_CAPACITY\_GROUP to create this guest into
- **test** (*bool*) – True will use `verifyOrder`, False will use `placeOrder`
- **guest\_object** (*dictionary*) – Below is the minimum info you need to send in `guest_object = { 'domain': 'test.com', 'hostname': 'A1538172419', 'os_code': 'UBUNTU_LATEST_64', 'primary_disk': '25', }`

**get\_available\_routers** (*dc=None*)

Pulls down all backendRouterIds that are available

**Parameters** **dc** (*string*) – A specific location to get routers for, like 'dal13'.

**Returns list** A list of locations where RESERVED\_CAPACITY can be ordered.

**get\_create\_options** ()  
List available reserved capacity plans

**get\_object** (*identifier*, *mask=None*)  
Get a Reserved Capacity Group

**Parameters**

- **identifier** (*int*) – Id of the SoftLayer\_Virtual\_ReservedCapacityGroup
- **mask** (*string*) – override default object Mask

**list** ()  
List Reserved Capacities

**resolve\_ids** (*identifier*)  
Takes a string and tries to resolve to a list of matching ids.

What exactly ‘identifier’ can be depends on the resolvers

**Parameters** **identifier** (*string*) – identifying string

**Returns** list

If you need more power or functionality than the managers provide, you can make direct API calls as well.

### 3.3 Making API Calls

For full control over your account and services, you can directly call the SoftLayer API. The SoftLayer API client for python leverages SoftLayer’s XML-RPC API. It supports authentication, object masks, object filters, limits, offsets, and retrieving objects by id. The following section assumes you have an initialized client named ‘client’.

The best way to test our setup is to call the `getObject` method on the `SoftLayer_Account` service.

```
client.call('Account', 'getObject')
```

For a more complex example we’ll retrieve a support ticket with id 123456 along with the ticket’s updates, the user it’s assigned to, the servers attached to it, and the datacenter those servers are in. To retrieve our extra information using an `object mask`.

Retrieve a ticket using object masks.

```
ticket = client.call('Ticket', 'getObject',  
                    id=123456, mask="updates, assignedUser, attachedHardware.datacenter")
```

Now add an update to the ticket with `Ticket.addUpdate`. This uses a parameter, which translate to positional arguments in the order that they appear in the API docs.

```
update = client.call('Ticket', 'addUpdate', {'entry' : 'Hello!'}, id=123456)
```

Let’s get a listing of virtual guests using the domain example.com

```
client.call('Account', 'getVirtualGuests',  
           filter={'virtualGuests': {'domain': {'operation': 'example.com'}}})
```

This call gets tickets created between the beginning of March 1, 2013 and March 15, 2013.

```

client.call('Account', 'getTickets',
    filter={
        'tickets': {
            'createDate': {
                'operation': 'betweenDate',
                'options': [
                    {'name': 'startDate', 'value': ['03/01/2013 0:0:0']},
                    {'name': 'endDate', 'value': ['03/15/2013 23:59:59']}
                ]
            }
        }
    }
)

```

SoftLayer's XML-RPC API also allows for pagination.

```

client.call('Account', 'getVirtualGuests', limit=10, offset=0) # Page 1
client.call('Account', 'getVirtualGuests', limit=10, offset=10) # Page 2

#Automatic Pagination (v5.5.3+)
client.call('Account', 'getVirtualGuests', iter=True) # Page 2

```

Here's how to create a new Cloud Compute Instance using `SoftLayer_Virtual_Guest.createObject`. Be warned, this call actually creates an hourly virtual server so this will have billing implications.

```

client.call('Virtual_Guest', 'createObject', {
    'hostname': 'myhostname',
    'domain': 'example.com',
    'startCpus': 1,
    'maxMemory': 1024,
    'hourlyBillingFlag': 'true',
    'operatingSystemReferenceCode': 'UBUNTU_LATEST',
    'localDiskFlag': 'false'
})

```

## 3.4 Debugging

If you ever need to figure out what exact API call the client is making, you can do the following:

*NOTE* the `print_reproduceable` method produces different output for REST and XML-RPC endpoints. If you are using REST, this will produce a CURL call. IF you are using XML-RPC, it will produce some pure python code you can use outside of the SoftLayer library.

```

# Setup the client as usual
client = SoftLayer.Client()
# Create an instance of the DebugTransport, which logs API calls
debugger = SoftLayer.DebugTransport(client.transport)
# Set that as the default client transport
client.transport = debugger
# Make your API call
client.call('Account', 'getObject')

# Print out the reproduceable call
for call in client.transport.get_last_calls():
    print(client.transport.print_reproduceable(call))

```

## 3.5 API Reference

### 3.5.1 SoftLayer Python API Client

SoftLayer API bindings

Usage:

```
>>> import SoftLayer
>>> client = SoftLayer.create_client_from_env(username="username",
                                             api_key="api_key")
>>> resp = client.call('Account', 'getObject')
>>> resp['companyName']
'Your Company'
```

**license** MIT, see LICENSE for more details.

**class** `SoftLayer.BaseClient` (*auth=None, transport=None*)  
Base SoftLayer API client.

#### Parameters

- **auth** – auth driver that looks like `SoftLayer.auth.AuthenticationBase`
- **transport** – An object that's callable with this signature: `transport(SoftLayer.transports.Request)`

**authenticate\_with\_password** (*username, password, security\_question\_id=None, security\_question\_answer=None*)

Performs Username/Password Authentication

#### Parameters

- **username** (*string*) – your SoftLayer username
- **password** (*string*) – your SoftLayer password
- **security\_question\_id** (*int*) – The security question id to answer
- **security\_question\_answer** (*string*) – The answer to the security question

**call** (*service, method, \*args, \*\*kwargs*)

Make a SoftLayer API call.

#### Parameters

- **method** – the method to call on the service
- **\*args** – (optional) arguments for the remote call
- **id** – (optional) id for the resource
- **mask** – (optional) object mask
- **filter** (*dict*) – (optional) filter dict
- **headers** (*dict*) – (optional) optional XML-RPC headers
- **compress** (*boolean*) – (optional) Enable/Disable HTTP compression
- **raw\_headers** (*dict*) – (optional) HTTP transport headers
- **limit** (*int*) – (optional) return at most this many results
- **offset** (*int*) – (optional) offset results by this many

- **iter** (*boolean*) – (optional) if True, returns a generator with the results
- **verify** (*bool*) – verify SSL cert
- **cert** – client certificate path

**Usage:**

```
>>> import SoftLayer
>>> client = SoftLayer.create_client_from_env()
>>> client.call('Account', 'getVirtualGuests', mask="id", limit=10)
[...]
```

**iter\_call** (*service, method, \*args, \*\*kwargs*)

A generator that deals with paginating through results.

**Parameters**

- **service** – the name of the SoftLayer API service
- **method** – the method to call on the service
- **limit** (*integer*) – result size for each API call (defaults to 100)
- **\*args** – same optional arguments that `Service.call` takes
- **\*\*kwargs** – same optional keyword arguments that `Service.call` takes

`SoftLayer.create_client_from_env` (*username=None, api\_key=None, endpoint\_url=None, timeout=None, auth=None, config\_file=None, proxy=None, user\_agent=None, transport=None, verify=True*)

Creates a SoftLayer API client using your environment.

Settings are loaded via keyword arguments, environmental variables and config file.

**Parameters**

- **username** – an optional API username if you wish to bypass the package’s built-in username
- **api\_key** – an optional API key if you wish to bypass the package’s built in API key
- **endpoint\_url** – the API endpoint base URL you wish to connect to. Set this to `API_PRIVATE_ENDPOINT` to connect via SoftLayer’s private network.
- **proxy** – proxy to be used to make API calls
- **timeout** (*integer*) – timeout for API requests
- **auth** – an object which responds to `get_headers()` to be inserted into the xml-rpc headers. Example: `BasicAuthentication`
- **config\_file** – A path to a configuration file used to load settings
- **user\_agent** – an optional User Agent to report when making API calls if you wish to bypass the packages built in User Agent string
- **transport** – An object that’s callable with this signature: `transport(SoftLayer.transports.Request)`
- **verify** (*bool*) – decide to verify the server’s SSL/TLS cert. DO NOT SET TO FALSE WITHOUT UNDERSTANDING THE IMPLICATIONS.

Usage:

```
>>> import SoftLayer
>>> client = SoftLayer.create_client_from_env()
>>> resp = client.call('Account', 'getObject')
>>> resp['companyName']
'Your Company'
```

`SoftLayer.Client` (*\*\*kwargs*)

Get a SoftLayer API Client using environmental settings.

Deprecated in favor of `create_client_from_env()`

**class** `SoftLayer.BasicAuthentication` (*username, api\_key*)

Token-based authentication class.

#### Parameters

- **str** (*api\_key*) – a user’s username
- **str** – a user’s API key

**get\_request** (*request*)

Sets token-based auth headers.

**exception** `SoftLayer.SoftLayerError`

The base SoftLayer error.

**exception** `SoftLayer.SoftLayerAPIError` (*fault\_code, fault\_string, \*args*)

`SoftLayerAPIError` is an exception raised during API errors.

Provides `faultCode` and `faultString` properties.

**class** `SoftLayer.SoftLayerListResult` (*items=None, total\_count=0*)

A SoftLayer API list result.

**total\_count** = None

total count of items that exist on the server. This is useful when paginating through a large list of objects.

---

## Command-line Interface

---

The SoftLayer command line interface is available via the `slcli` command available in your *PATH*. The `slcli` command is a reference implementation of SoftLayer API bindings for python and how to efficiently make API calls. See the *Usage Examples* section to see how to discover all of the functionality not fully documented here.

### 4.1 Interacting with IPSEC Tunnels

The IPSEC *Command-line Interface* commands can be used to configure an existing IPSEC tunnel context. Subnets in the SoftLayer private network can be associated to the tunnel context along with user-defined remote subnets. Address translation entries may also be defined to provide NAT functionality from static subnet IP addresses associated with the tunnel context to user-defined remote subnet IP addresses.

---

**Note:** Most CLI actions that affect an IPSEC tunnel context do not result in configuration changes to SoftLayer network devices. A separate `configure` command is available to issue a device configuration request.

---

To see more information about the IPSEC tunnel context module and API interaction, see *IPSEC Module* documentation.

#### 4.1.1 ipsec list

A list of all IPSEC tunnel contexts associated with the current user's account can be retrieved via the `ipsec list` command. This provides a brief overview of all tunnel contexts and can be used to retrieve an individual context's identifier, which all other CLI commands require.

```
$ slcli ipsec list
:.....:
↪:.....:
: id :   name   : friendly name : internal peer IP address : remote peer IP address_
↪:         created          :
:.....:
↪:.....: (continues on next page)
```

(continued from previous page)

```

:.....:.....:.....:.....:
: id : network identifier : cidr : note :
:.....:.....:.....:.....:
: 7852 : 158.85.80.20 : 30 : :
:.....:.....:.....:.....:
Static Subnets:
:.....:.....:.....:.....:
: id : network identifier : cidr : note :
:.....:.....:.....:.....:
: 231807 : 10.1.249.84 : 30 : :
:.....:.....:.....:.....:
Service Subnets:
:.....:.....:.....:.....:
: id : network identifier : cidr : note :
:.....:.....:.....:.....:
: 162079 : 10.0.80.0 : 25 : :
:.....:.....:.....:.....:

```

### 4.1.3 ipsec update

Most values listed in the tunnel context detail printout can be modified using the `ipsec update` command. The following is given when executing with the `-h|--help` option and highlights all properties that may be modified.

```

$ slcli ipsec update -h
Usage: slcli ipsec update [OPTIONS] CONTEXT_ID

Update tunnel context properties.

Updates are made atomically, so either all are accepted or none are.

Key life values must be in the range 120-172800.

Phase 2 perfect forward secrecy must be in the range 0-1.

A separate configuration request should be made to realize changes on
network devices.

Options:
  --friendly-name TEXT           Friendly name value
  --remote-peer TEXT            Remote peer IP address value
  --preshared-key TEXT          Preshared key value
  --p1-auth, --phase1-auth [MD5|SHA1|SHA256]
                                Phase 1 authentication value
  --p1-crypto, --phase1-crypto [DES|3DES|AES128|AES192|AES256]
                                Phase 1 encryption value
  --p1-dh, --phase1-dh [0|1|2|5] Phase 1 diffie hellman group value
  --p1-key-ttl, --phase1-key-ttl INTEGER RANGE
                                Phase 1 key life value
  --p2-auth, --phase2-auth [MD5|SHA1|SHA256]
                                Phase 2 authentication value
  --p2-crypto, --phase2-crypto [DES|3DES|AES128|AES192|AES256]
                                Phase 2 encryption value
  --p2-dh, --phase2-dh [0|1|2|5] Phase 2 diffie hellman group value
  --p2-forward-secrecy, --phase2-forward-secrecy INTEGER RANGE
                                Phase 2 perfect forward secrecy value

```

(continues on next page)

(continued from previous page)

```
--p2-key-ttl, --phase2-key-ttl INTEGER RANGE
                               Phase 2 key life value
-h, --help                    Show this message and exit.
```

#### 4.1.4 ipsec configure

A request to configure SoftLayer network devices for a given tunnel context can be issued using the `ipsec configure` command.

---

**Note:** Once a configuration request is received, the IPSEC tunnel context will be placed into an unmodifiable state, and further changes against the tunnel context will be prevented. Once configuration changes have been made, the tunnel context may again be modified. The unmodifiable state of a tunnel context is indicated by an *advanced configuration flag* value of 1.

---

#### 4.1.5 ipsec subnet-add

Internal, remote and service subnets can be associated to an IPSEC tunnel context using the `ipsec subnet-add` command. Additionally, remote subnets can be created using this same command, which will then be associated to the targeted tunnel context.

---

**Note:** The targeted subnet type must be specified. A subnet id must be provided when associating internal and service subnets. Either a subnet id or a network identifier must be provided when associating remote subnets. If a network identifier is provided when associating a remote subnet, that subnet will first be created and then associated to the tunnel context.

---

The following is an example of associating an internal subnet to a tunnel context.

```
$ slcli ipsec subnet-add 445 --subnet-id 180767 --subnet-type internal
Added internal subnet #180767
```

The following is an example of creating and associating a remote subnet to a tunnel context.

```
$ slcli ipsec subnet-add 445 --subnet-type remote --network 50.100.0.0/26
Created subnet 50.100.0.0/26 #21268
Added remote subnet #21268
```

#### 4.1.6 ipsec subnet-remove

Internal, remote and service subnets can be disassociated from an IPSEC tunnel context via the `ipsec subnet-remove` command.

---

**Note:** The targeted subnet id and type must be specified. When disassociating remote subnets, that subnet record will also be deleted.

---

The following is an example of disassociating an internal subnet from a tunnel context.

```
$ slcli ipsec subnet-remove 445 --subnet-id 180767 --subnet-type internal
Removed internal subnet #180767
```

### 4.1.7 ipsec translation-add

Address translation entries can be added to a tunnel context to provide NAT functionality from a statically routed subnet associated with the tunnel context to a remote subnet. This action is performed with the `ipsec translation-add` command.

---

**Note:** Both static and remote IP address values must be specified. An optional note value may also be provided.

---

The following is an example of adding a new address translation entry.

```
$ slcli ipsec translation-add 445 --static-ip 10.1.249.87 --remote-ip 50.100.0.10 --
↳note 'email server'
Created translation from 10.1.249.87 to 50.100.0.10 #15922
```

### 4.1.8 ipsec translation-remove

Address translation entries can be removed using the `ipsec translation-remove` command.

The following is an example of removing an address translation entry.

```
$ slcli ipsec translation-remove 445 --translation-id 15922
Removed translation #15922
```

### 4.1.9 ipsec translation-update

Address translation entries may also be modified using the `ipsec translation-update` command.

The following is an example of updating an existing address translation entry.

```
$ slcli ipsec translation-update 445 --translation-id 15924 --static-ip 10.1.249.86 --
↳remote-ip 50.100.0.8 --note 'new email server'
Updated translation #15924
```

## 4.2 Working with Virtual Servers

Using the SoftLayer portal to order virtual servers is fine, but for a number of reasons it's often more convenient to use the command line. For this, you can use SoftLayer's command-line client to make administrative tasks quicker and easier. This page gives an intro to working with SoftLayer virtual servers using SoftLayer's command-line client.

---

**Note:** The following assumes that the client is already *configured with valid SoftLayer credentials*.

---

First, let's list the current virtual servers with `slcli vs list`.

```

$ slcli vs list
:.....:
↪.....:
: id : datacenter :          host          : cores : memory : primary_ip : ↵
↪backend_ip : active_transaction : owner :
:.....:
↪.....:
:.....:
↪.....:

```

We don't have any virtual servers yet! Let's fix that. Before we can create a virtual server (VS), we need to know what options are available to us: RAM, CPU, operating systems, disk sizes, disk types, datacenters, and so on. Luckily, there's a simple command to show all options: `slcli vs create-options`.

*Some values were omitted for brevity*

```

$ slcli vs create-options
:.....:
↪.....:
:          name : value                               ↵
↪          :
:.....:
↪.....:
:          datacenter : ams01                               ↵
↪          :
:          : ams03                               ↵
↪          :
:          : wdc07                               ↵
↪          :
:          flavors (balanced) : B1_1X2X25                           ↵
↪          :
:          : B1_1X2X25                           ↵
↪          :
:          : B1_1X2X100                          ↵
↪          :
:          cpus (standard) : 1,2,4,8,12,16,32,56                  ↵
↪          :
:          cpus (dedicated) : 1,2,4,8,16,32,56                     ↵
↪          :
:          cpus (dedicated host) : 1,2,4,8,12,16,32,56                 ↵
↪          :

:          local disk(2) : 25,100,150,200,300
↪          :
: local (dedicated host) disk(0) : 25,100
↪          :
:          nic (dedicated host) : 100,1000
↪          :
:.....:.....
↪.....:.....

```

Here's the command to create a 2-core virtual server with 1GiB memory, running Ubuntu 14.04 LTS, and that is billed on an hourly basis in the San Jose 1 datacenter using the command `slcli vs create`.

```

$ slcli vs create --hostname=example --domain=softlayer.com --cpu 2 --memory 1024 -o_
↪DEBIAN_LATEST_64 --datacenter=ams01 --billing=hourly
This action will incur charges on your account. Continue? [y/N]: y
:.....:.....
:   name : value
:.....:.....
:   id   : 1234567
: created : 2013-06-13T08:29:44-06:00
:   guid  : 6e013cde-a863-46ee-8s9a-f806dba97c89
:.....:.....

```

After the last command, the virtual server is now being built. It should instantly appear in your virtual server list now.

```
$ slcli vs list
:.....:
↪.....:
:   id   : datacenter :          host      : cores : memory :   primary_ip   :
↪backend_ip : active_transaction :
:.....:
↪.....:
: 1234567 :   ams01   : example.softlayer.com :    2   :   1G   : 108.168.200.11 : 10.
↪54.80.200 :   Assign Host   :
:.....:
↪.....:
```

Cool. You may ask, “It’s creating... but how do I know when it’s done?” Well, here’s how:

```
$ slcli vs ready 'example' --wait=600
READY
```

When the previous command returns, you’ll know that the virtual server has finished the provisioning process and is ready to use. This is *very* useful for chaining commands together.

Now that you have your virtual server, let’s get access to it. To do that, use the `slcli vs detail` command. From the example below, you can see that the username is ‘root’ and password is ‘ABCDEFGH’.

**Warning:** Be careful when using the `--passwords` flag. This will print the virtual server’s password on the screen. Make sure no one is looking over your shoulder. It’s also advisable to change your root password soon after creating your virtual server, or to create a user with sudo access and disable SSH-based login directly to the root account.

```
$ slcli vs detail example --passwords
:.....:
:      Name : Value      :
:.....:
:      id   : 1234567      :
:  hostname : example.softlayer.com :
:  status   : Active       :
:  state    : Running      :
:  datacenter : ams01       :
:  cores    : 2            :
:  memory   : 1G          :
:  public_ip : 108.168.200.11 :
:  private_ip : 10.54.80.200 :
:  os       : Debian      :
:  private_only : False      :
:  private_cpu : False      :
:  created   : 2013-06-13T08:29:44-06:00 :
:  modified  : 2013-06-13T08:31:57-06:00 :
:  users     : root ABCDEFGH :
:.....:
```

There are many other commands to help manage virtual servers. To see them all, use `slcli help vs`.

```
$ slcli vs
Usage: slcli vs [OPTIONS] COMMAND [ARGS]...

Virtual Servers.
```

(continues on next page)

(continued from previous page)

```
Options:
  --help  Show this message and exit.

Commands:
  cancel          Cancel virtual servers.
  capture         Capture SoftLayer image.
  create          Order/create virtual servers.
  create-options  Virtual server order options.
  credentials     List virtual server credentials.
  detail         Get details for a virtual server.
  dns-sync       Sync DNS records.
  edit           Edit a virtual server's details.
  list           List virtual servers.
  network        Manage network settings.
  pause         Pauses an active virtual server.
  power_off      Power off an active virtual server.
  power_on      Power on a virtual server.
  ready         Check if a virtual server is ready.
  reboot        Reboot an active virtual server.
  reload        Reload operating system on a virtual server.
  rescue        Reboot into a rescue image.
  resume        Resumes a paused virtual server.
  upgrade       Upgrade a virtual server.
```

## 4.2.1 Reserved Capacity

### Working with Reserved Capacity

There are two main concepts for Reserved Capacity. The [Reserved Capacity Group](#) and the [Reserved Capacity Instance](#). The Reserved Capacity Group, is a set block of capacity set aside for you at the time of the order. It will contain a set number of Instances which are all the same size. Instances can be ordered like normal VSIs, with the exception that you need to include the `reservedCapacityGroupId`, and it must be the same size as the group you are ordering the instance in.

- [About Reserved Capacity](#)
- [Reserved Capacity FAQ](#)

The SLCLI supports some basic Reserved Capacity Features.

#### vs capacity create

This command will create a Reserved Capacity Group.

**Warning:** These groups can not be canceled until their contract expires in 1 or 3 years!

```
$ slcli vs capacity create --name test-capacity -d dal13 -b 1411193 -c B1_1X2_1_YEAR_
↪TERM -q 10
```

### vs cacpacity create\_options

This command will print out the Flavors that can be used to create a Reserved Capacity Group, as well as the backend routers available, as those are needed when creating a new group.

### vs capacity create\_guest

This command will create a virtual server (Reserved Capacity Instance) inside of your Reserved Capacity Group. This command works very similar to the *slcli vs create* command.

```
$ slcli vs capacity create-guest --capacity-id 1234 --primary-disk 25 -H ABCD -D test.  
↪com -o UBUNTU_LATEST_64 --ipv6 -k test-key --test
```

### vs capacity detail

This command will print out some basic information about the specified Reserved Capacity Group.

### vs capacity list

This command will list out all Reserved Capacity Groups. a # symbol represents a filled instance, and a - symbol represents an empty instance

```
$ slcli vs capacity list  
:.....  
↪.....:  
:                               Reserved Capacity                               ↪  
↪                               :

↪.....:.....:.....:.....:.....:.....:.....:.....:.....:.....:.....:.....
```

## 4.3 Ordering

The Order *Command-line Interface* commands can be used to build an order for any product in the SoftLayer catalog.

The basic flow for ordering goes something like this...

1. package-list
2. category-list <package key name>
3. item-list <package key name>
4. place <package key name> <item key names> <location>

### 4.3.1 order package-list

This command will list all of the packages that are available to be ordered. This is the starting point for placing any order. Find the package keyName you want to order, and use it for the next steps.

---

**Note:**

- CLOUD\_SERVER: These are Virtual Servers
- BARE\_METAL\_INSTANCE: Hourly Bare Metal
- BARE\_METAL\_SERVER: Other monthly server types
- #\_PROC#\_DRIVES: Packages in this format will contain only this CPU model and Drive bays
- ADDITIONAL\_PRODUCTS: Additional IPs, Vlans, SSL certs and other things are in here
- NETWORK\_GATEWAY\_APPLIANCE: Vyattas

Bluemix services listed here may still need to be ordered through the Bluemix CLI/Portal

---

### 4.3.2 order category-list

Shows all the available categories for a certain package, useful in finding the required categories. Categories that are required will need to have a corresponding item included with any orders

These are all the required categories for BARE\_METAL\_SERVER

```
$ slcli order category-list BARE_METAL_SERVER
:.....:.....:.....:
:      name      :      categoryCode      : isRequired :
:.....:.....:.....:
:      Server      :      server      :      Y      :
:      Operating System      :      os      :      Y      :
:      RAM      :      ram      :      Y      :
:      Disk Controller      :      disk_controller      :      Y      :
:      First Hard Drive      :      disk0      :      Y      :
:      Public Bandwidth      :      bandwidth      :      Y      :
:      Uplink Port Speeds      :      port_speed      :      Y      :
:      Remote Management      :      remote_management      :      Y      :
:      Primary IP Addresses      :      pri_ip_addresses      :      Y      :
:      VPN Management - Private Network      :      vpn_management      :      Y      :
:.....:.....:.....:
```

### 4.3.3 order item-list

Shows all the prices for a given package. Collect all the items you want included on your server. Don't forget to include the required category items. If forgotten, `order place` will tell you about it.

### 4.3.4 order preset-list

Some packages have presets which makes ordering significantly simpler. These will have set CPU / RAM / Disk allotments. You still need to specify required items

### 4.3.5 order place

Now that you have the package you want, the prices needed, and found a location, it is time to place an order.

#### order place <preset>

```
$ slcli --really order place --preset D2620V4_64GB_2X1TB_SATA_RAID_1 BARE_METAL_
↪SERVER TORONTO \
  OS_UBUNTU_16_04_LTS_XENIAL_XERUS_64_BIT \
  BANDWIDTH_0_GB_2 \
  1_GBPS_PRIVATE_NETWORK_UPLINK \
  REBOOT_KVM_OVER_IP 1_IP_ADDRESS \
  UNLIMITED_SSL_VPN_USERS_1_PPTP_VPN_USER_PER_ACCOUNT \
  --extras '{"hardware": [{"hostname": "testOrder", "domain": "cgallo.com"}]}' \
  --complex-type SoftLayer_Container_Product_Order_Hardware_Server
```

#### order place <Virtual Server>

```
$ slcli order place --billing hourly CLOUD_SERVER DALLAS13 \
  GUEST_CORES_4 \
  RAM_16_GB \
  REBOOT_REMOTE_CONSOLE \
  1_GBPS_PUBLIC_PRIVATE_NETWORK_UPLINKS \

  --extras '{"virtualGuests": [{"hostname": "test", "domain": "softlayer.com"}]}' \
  --complex-type SoftLayer_Container_Product_Order_Virtual_Guest
```

## 4.4 Users

Version 5.6.0 introduces the ability to interact with user accounts from the cli.

### 4.4.1 user create

This command will create a user on your account.

#### Options

- e, --email TEXT** Email address for this user. Required for creation. [required]
- p, --password TEXT** Password to set for this user. If no password is provided, user will be sent an email to generate one, which expires in 24 hours. ‘-p generate’ will create a password for you (Requires Python 3.6+). Passwords require 8+ characters, upper and lowercase, a number and a symbol.

- u, --from-user TEXT** Base user to use as a template for creating this user. Will default to the user running this command. Information provided in `--template` supersedes this template.
- t, --template TEXT** A json string describing [https://softlayer.github.io/reference/datatypes/SoftLayer\\_User\\_Customer/](https://softlayer.github.io/reference/datatypes/SoftLayer_User_Customer/)
- a, --api-key** Create an API key for this user.
- h, --help** Show this message and exit.

```
:: slcli user create my@email.com -e my@email.com -p generate -a -t '{"firstName": "Test", "lastName": "Tester-son"}'
```

## 4.4.2 user list

This command will list all Active users on the account that your user has access to view. There is the option to also filter by username

## 4.4.3 user detail <user>

Gives a variety of details about a specific user. <user> can be a user id, or username. Will always print a basic set of information about the user, but there are a few extra flags to pull in more detailed information.

### **user detail <user> -p, --permissions**

Will list the permissions the user has. To see a list of all possible permissions, or to change a user's permissions, see *user permissions <user>*

### **user detail <user> -h, --hardware**

Will list the Hardware and Dedicated Hosts the user is able to access.

### **user detail <user> -v, --virtual**

Will list the Virtual Guests the user has access to.

### **user detail <user> -l, --logins**

Show login history of this user for the last 30 days. IBMId Users will show logins properly, but may not show failed logins.

### **user detail <user> -e, --events**

Shows things that are logged in the Event\_Log service. Logins, reboots, reloads, and other such actions will show up here.

### **user permissions <user>**

Will list off all permission keyNames, along with which are assigned to that specific user.

#### 4.4.4 user edit-permissions

Enable or Disable specific permissions. It is possible to set multiple permissions in one command as well.

```
$ slcli user edit-permissions USERID --enable -p TICKET_EDIT -p TICKET_ADD -p TICKET_
↪SEARCH
```

Will enable TICKET\_EDIT, TICKET\_ADD, and TICKET\_SEARCH permissions for the USERID

#### 4.4.5 user edit-details

Edit a User's details

JSON strings should be enclosed in ' and each item should be enclosed in ""

```
:: slcli user edit-details testUser -t '{"firstName": "Test", "lastName": "Testerson"}'
```

#### Options

**-t, --template TEXT** A json string describing 'SoftLayer\_User\_Customer

[https://softlayer.github.io/reference/datatypes/SoftLayer\\_User\\_Customer/](https://softlayer.github.io/reference/datatypes/SoftLayer_User_Customer/) [required] -h, --help Show this message and exit.

### 4.5 Configuration Setup

To update the configuration, you can use *slcli setup*.

```
$ slcli setup
Username []: username
API Key or Password []:
Endpoint (public|private|custom): public
:.....:
:      Name : Value                                     :
:.....:
:      Username : username                                           :
:      API Key  : oyVmeipYQCNrjVS4rF9bHWV7D75S6pa1fghF1384v7mWRcbHTfuJ8qRORIqoVnha :
:      Endpoint URL : https://api.softlayer.com/xmlrpc/v3/                          :
:.....:
Are you sure you want to write settings to "/home/me/.softlayer"? [y/N]: y
```

To check the configuration, you can use *slcli config show*.

```
$ slcli config show
:.....:
:      Name : Value                                     :
:.....:
:      Username : username                                           :
:      API Key  : oyVmeipYQCNrjVS4rF9bHWV7D75S6pa1fghF1384v7mWRcbHTfuJ8qRORIqoVnha :
:      Endpoint URL : https://api.softlayer.com/xmlrpc/v3/                          :
:.....:
```

To see more about the config file format, see *Configuration File*.

## 4.6 Usage Examples

To discover the available commands, simply type *slcli*.

```

$ slcli
Usage: slcli [OPTIONS] COMMAND [ARGS]...

SoftLayer Command-line Client

Options:
  --format [table|raw|json|jsonraw]
                                Output format [default: table]
  -C, --config PATH              Config file location [default:
                                ~/.softlayer]
  -v, --verbose                  Sets the debug noise level, specify multiple
                                times for more verbosity.
  --proxy TEXT                   HTTP[S] proxy to be use to make API calls
  -y, --really / --not-really    Confirm all prompt actions
  --demo / --no-demo             Use demo data instead of actually making API
                                calls
  --version                      Show the version and exit.
  -h, --help                    Show this message and exit.

Commands:
  block          Block Storage.
  call-api      Call arbitrary API endpoints.
  cdn           Content Delivery Network.
  config        CLI configuration.
  dns          Domain Name System.
  file         File Storage.
  firewall     Firewalls.
  globalip    Global IP addresses.
  hardware    Hardware servers.
  image       Compute images.
  loadbal     Load balancers.
  messaging   Message queue service.
  metadata    Find details about this machine.
  nas         Network Attached Storage.
  object-storage Object Storage.
  report      Reports.
  rwhois     Referral Whois.
  setup      Edit configuration.
  shell     Enters a shell for slcli.
  sshkey    SSH Keys.
  ssl       SSL Certificates.
  subnet   Network subnets.
  summary  Account summary.
  ticket   Support tickets.
  virtual  Virtual Servers.
  vlan     Network VLANs.

To use most commands your SoftLayer username and api_key need to be
configured. The easiest way to do that is to use: 'slcli setup'

```

As you can see, there are a number of commands/sections. To look at the list of subcommands for virtual servers type *slcli vs*. For example:

(continued from previous page)

<code>-m, --memory INTEGER</code>	Memory in mebibytes
<code>-n, --network TEXT</code>	Network port speed in Mbps
<code>--hourly</code>	Show only hourly instances
<code>--monthly</code>	Show only monthly instances
<code>--tags TEXT</code>	Show instances that have one of these comma-separated tags
<code>--help</code>	Show this message and exit.

## 5.1 Contribution Guide

This page explains how to get started contributing code to the SoftLayer API Python Bindings project.

### 5.1.1 Code Organization

- **docs** - Where The source to this documentation lives.
- **SoftLayer** - All the source lives under here.
  - **API** - Primary API client.
  - **CLI** - Code for the command-line interface.
  - **managers** - API Managers. Abstractions to help use the API.

### 5.1.2 Setting Up A Dev Environment

Before working with the SoftLayer Python API client source, we strongly recommend that you know how to use Python's virtual environment, [virtualenv](#). Virtualenv allows you to create isolated Python environments that are individually tailored to particular development projects. Each environment can have its own set of libraries and even its own Python interpreter. This keeps them fully isolated, reducing the possibility of library conflicts between different projects.

After you have virtualenv, you should set up a virtual environment and activate it whenever you are working on softlayer-python. The commands needed to setup an environment and activate it might look something like this:

```
virtualenv --no-site-packages softlayer_env
source softlayer_env/bin/activate
```

Please refer to the virtualenv documentation for more information about creating, and working with virtual environments.

Once you have an appropriate environment, you will then download the SoftLayer API Python Bindings source code by following the *installation instructions*. Change into `softlayer-python` source directory and run the following to install the pre-requisites that you'll need in order to run the test suites:

```
pip install -r tools/test-requirements.txt
```

### 5.1.3 Testing

The project has a mix of functional and unit tests. Before submitting changes to be integrated into the project, you should validate your code using `tox`. Simply issue the `tox` command from the root of the source tree:

```
tox
```

In addition to testing different versions of Python, `tox` checks for common mistakes in the code using `Flake8` and `pylint`. You should eliminate the linting errors that are reported before submitting your code. You can run only the linting checks by using this command:

```
tox -eanalysis
```

The project's configuration instructs `tox` to test against many different versions of Python. A `tox` test will use as many of those as it can find on your local computer. Rather than installing all those versions, we recommend that you point the `Travis` continuous integration tool at your GitHub fork. `Travis` will run the test against the full suite of Python versions every time you push new code.

Using `tox` to run tests in multiple environments can be very time consuming. If you wish to quickly run the tests in your own environment, you may do so using `py.test`. The command to do that is:

```
py.test tests
```

### Fixtures

Testing of this project relies quite heavily on fixtures to simulate API calls. When running the unit tests, we use the `FixtureTransport` class, which instead of making actual API calls, loads data from `/fixtures/SoftLayer_Service_Name.py` and tries to find a variable that matches the method you are calling.

When adding new Fixtures you should try to sanitize the data of any account identifying results, such as account ids, username, and that sort of thing. It is ok to leave the id in place for things like datacenter ids, price ids.

To Overwrite a fixture, you can use a mock object to do so. Like either of these two methods:

```
# From tests/CLI/modules/vs_capacity_tests.py
from SoftLayer.fixtures import SoftLayer_Product_Package

def test_create_test(self):
    item_mock = self.set_mock('SoftLayer_Product_Package', 'getItems')
    item_mock.return_value = SoftLayer_Product_Package.getItems_RESERVED_CAPACITY

def test_detail_pending(self):
    capacity_mock = self.set_mock('SoftLayer_Virtual_ReservedCapacityGroup',
    ↪ 'getObject')
    get_object = {
        'name': 'test-capacity',
        'instances': []
    }
    capacity_mock.return_value = get_object
```

## 5.1.4 Documentation

The project is documented in [reStructuredText](#) and built using [Sphinx](#). If you have [fabric](#) installed, you simply need to run the following to build the docs:

```
fab make_html
```

The documentation will be built in `docs/_build/html`. If you don't have [fabric](#), use the following commands.

```
cd docs
make html
sphinx-build -b html ./ ./html
```

The primary docs are built at [Read the Docs](#).

## 5.1.5 Style

This project tries to follow [PEP 8](#) and most of the style suggestions that [pyflakes](#) recommends. Run [Flake8](#) regularly. [Flake8](#), with project-specific exceptions, can be run by using [tox](#):

```
tox -e analysis
```

[Autopep8](#) can fix a lot of the simple [flake8](#) errors about whitespace and indentation.

```
autopep8 -r -a -v -i --max-line-length 119
```

## 5.1.6 Contributing

Contributing to the Python API bindings follows the [fork-pull-request model](#) on [GitHub](#). The project uses [GitHub's issue tracker](#) and [pull requests](#) to manage source control, bug fixes and new feature development regarding the API bindings and the CLI. In order to contribute, we require that you sign a contributor agreement:

- Sign our contributor agreement (CLA) You can find the [CLA](#) [here](#).
- If you're contributing on behalf of your employer we'll need a signed copy of our corporate contributor agreement (CCLA) as well. You can find the [CCLA](#) [here](#).

## 5.1.7 Developer Resources

# 5.2 Command-Line Interface Developer Guide

The SoftLayer CLI can be used to manage many different SoftLayer services directly from the command line.

The command line parsing is currently based on [click](#), which is a command parsing library along with some additions to dynamically load modules from a routes-like file and from [entry points](#).

## 5.2.1 First Example

For the first example, we can create `slcli table-example` by creating the following file at `SoftLayer/CLI/table_example.py`:

```

"""A formatting table example."""
from SoftLayer.CLI import environment
from SoftLayer.CLI import formatting

import click

@click.command()
@environment.pass_env
def cli(env):
    """This returns an table that highlights how tables are output"""
    # create a table with two columns: col1, col2
    table = formatting.Table(['col1', 'col2'])

    # align the data facing each other
    # valid values are r, c, l for right, center, left
    # note, these are suggestions based on the format chosen by the user
    table.align['col1'] = 'r'
    table.align['col2'] = 'l'

    # add rows
    table.add_row(['test', 'test'])
    table.add_row(['test2', 'test2'])

    env.fout(table)

```

Then we need to register it so that *slcli table-example* will know to route to this new module. We do that by adding `ALL_ROUTES` in `SoftLayer/CLI/routes.py` to include the following:

```

...
('table-example', 'SoftLayer.CLI.table_example:cli'),
...

```

Which gives us

```

$ slcli table-example
:.....:.....:
:  col1 : col2  :
:.....:.....:
:  test : test  :
: test2 : test2 :
:.....:.....:

$ slcli --format=raw table-example
test  test
test2 test2

```

Formatting of the data represented in the table is actually controlled upstream from the `CLIRunnable`'s making supporting more data formats in the future easier.

## 5.2.2 Arguments

A command usually isn't very useful without context or arguments of some kind. With click, you have a large array of argument and option types at your disposal. Additionally, with the SoftLayer CLI, we have global options and context which is stored in `SoftLayer.CLI.environment.Environment` and is attainable through a decorator located at `SoftLayer.CLI.environment.pass_env`. An example of options and the environment is shown below. It also shows how

output should be done using *env.out* instead of printing. This is used for testing and to have a consistent way to print things onto the screen.

```

from SoftLayer.CLI import environment

import click

@click.command()
@click.option("--number",
              required=True,
              type=click.INT,
              help="print different output")
@click.option("--choice",
              type=click.Choice(['this', 'that']),
              help="print different output")
@click.option("--test", help="print different output")
@environment.pass_env
def cli(env, number, choice, test):
    """Argument parsing example"""

    if test:
        env.out("Just testing, move along...")
    else:
        env.out("This is fo'realz!")

    if choice == 'this':
        env.out("Selected this")
    elif choice == 'that':
        env.out("Selected that")

    env.out("This is a number: %d" % number)

```

Refer to the click library documentation for more options.

### 5.2.3 Accessing the API

A *SoftLayer* client is stood up for every command and is available through *SoftLayer.CLI.environment.Environment.client*. The example below shows how to make a simple API call to the *SoftLayer\_Account::getObject*.

```

from SoftLayer.CLI import environment

import click

@click.command()
@environment.pass_env
def cli(env):
    """Using the SoftLayer API client"""

    account = env.client['Account'].getObject()
    return account['companyName']

```

## 5.2.4 Aborting execution

When a confirmation fails, you probably want to stop execution and give a non-zero exit code. To do that, raise a *SoftLayer.CLI.exceptions.CLIAbort* exception with the message for the user as the first parameter. This will prevent any further execution and properly return the right error code.

```
raise CLIAbort("Aborting. Failed confirmation")
```
