sphinxcontrib.argdoc Documentation

Release 0.1.3-r2015$_0 7_0 9$

Joshua G. Dunn

July 09, 2015

Introduction

`sphinxcontrib.argdoc` is an extension for the Sphinx documentation engine.

It automatically generates tables describing command-line arguments for executable scripts written in Python, and inserts those tables into the scripts' `:automodule:` documentation. The only requirements are:

1. The exectuable scripts use the Python `argparse` module for argument parsing

2. The `rst` stub files for the scripts include the `:automodule:` directive (which they will, by default, if you use sphinx-apidoc).

To start using `sphinxcontrib.argdoc`, see the `quickstart` guide.

To view the source code, check out the sphinx-contrib repository on BitBucket.
